THE EAF-NANSEN PROJECT

FAO started the implementation of the project “Strengthening the Knowledge Base for and Implementing an Ecosystem Approach to Marine Fisheries in Developing Countries (EAF-Nansen GCP/INT/003/NOR)” in December 2006 with funding from the Norwegian Agency for Development Cooperation (Norad). The EAF-Nansen project is a follow-up to earlier projects/programmes in a partnership involving FAO, Norad and the Institute of Marine Research (IMR), Bergen, Norway on assessment and management of marine fishery resources in developing countries. The project works in partnership with governments and also GEF-supported Large Marine Ecosystem (LME) projects and other projects that have the potential to contribute to some components of the EAF-Nansen project.

The EAF-Nansen project offers an opportunity to coastal countries in sub-Saharan Africa, working in partnership with the project, to receive technical support from FAO for the development of national and regional frameworks for the implementation of Ecosystem Approach to Fisheries management and to acquire additional knowledge on their marine ecosystems for their use in planning and monitoring. The project contributes to building the capacity of national fisheries management administrations in ecological risk assessment methods to identify critical management issues and in the preparation, operationalization and tracking the progress of implementation of fisheries management plans consistent with the ecosystem approach to fisheries.

LE PROJET EAF-NANSEN

La FAO a initié la mise en oeuvre du projet "Renforcement de la base des connaissances pour mettre en œuvre une approche écosystémique des pêcheries marines dans les pays en développement (EAF-Nansen GCP/INT/003/NOR)" en décembre 2006. Le projet est financé par de l'Agence norvégienne de coopération pour le développement (Norad). Le projet EAF-Nansen fait suite aux précédents projets/ programmes dans le cadre du partenariat entre la FAO, Norad et l'Institut de recherche marine (IMR) de Bergen en Norvège, sur l'évaluation et l'aménagement des ressources halieutiques dans les pays en développement. Le projet est mis en oeuvre en partenariat avec les gouvernements et en collaboration avec les projets grands écosystèmes marins (GEM) soutenus par le Fonds pour l'Environnement Mondial (FEM) et d'autres projets régionaux qui ont le potentiel de contribuer à certains éléments du projet EAF-Nansen.

Le projet EAF-Nansen offre l'opportunité aux pays côtiers de l'Afrique subsaharienne partenaires de recevoir un appui technique de la FAO pour le développement de cadres nationaux et régionaux visant une approche écosystémique de l'aménagement des pêches et la possibilité d'acquérir des connaissances complémentaires sur leurs écosystèmes marins. Ces éléments seront utilisés pour la planification et le suivi des pêcheries et de leurs écosystèmes. Le projet contribue à renforcer les capacités des administrations nationales responsables de l'aménagement des pêches en introduisant des méthodes d'évaluation des risques écologiques pour identifier les questions d'aménagement d'importance majeure ainsi que la préparation, la mise en œuvre et le suivi des progrès de la mise en œuvre de plans d'aménagement des ressources marines conformes à l'approche écosystémique des pêches.

The Programme has previously conducted the following demersal surveys in the area:

Area		Period
January 1985	-	June 1986 (6 surveys)
January 1989	-	December 1989 (3 surveys)
May 1991	-	September 1992 (3 surveys)
January 1994	-	August 2007 (17 surveys)

CHAPTER 1 INTRODUCTION

1.1 Objectives

This survey is one of a series aimed at monitoring the pelagic fish resources of Angola, as agreed with the Instituto Nacional de Investigação Pesqueira (INIP), Luanda and to improve the understanding and knowledge in terms of the biology, ecology, population dynamics of the main species in relation to the environment and the whole ecosystem. Pelagic management decisions for 2008 will be based on the results obtained from this survey.

The specific objectives of the survey were the following:

- To estimate the abundance and to map the distribution of the main commercially important pelagic and semi-pelagic fish species in Angolan waters, including the two sardinella species *Sardinella aurita* and *S. maderensis*, the Cunene horse mackerel *Trachurus trecae*, the Cape horse mackerel *Trachurus trachurus capensis* and other pelagic species.
- To collect gonads, stomachs and otoliths from both horse mackerel and sardinella species, and to collect depth stratified samples of zoo and phytoplankton in order to continue the studies on feeding biology, relating stomach contents to estimated zooplankton compositions and densities.
- To map the general meteorological, hydrographical and biological conditions in the survey area by means of continuous recordings of weather data, CTD-casts (Temperature, Salinity and Oxygen), ADCP measurements (Acoustic Doppler Current Profiler) and plankton sampling along acoustical and hydrographical transect lines.
- On-the-job training for the local and regional participants on the main survey routines, including using the Nansis and Hydrobase software, scrutinizing acoustical data with the latest Norwegian post-processing system, Large Scale Survey System (LSSS), and producing acoustical biomass estimates.
- To measure target strength (TS) of Angolan pelagic species.

1.2 Participation

The scientific staff consisted of:

From INIP, Luanda:

Nkosi LUYEYE (Team leader, 7/7 – 15/7), Paulo CELSO (7/7 – 15/7), João GOUVEIA EUSÉBIO DÍAS DOS SANTOS (7/7 – 15/7), Paula FARIA (7/7 – 15/7), Iris VILLAR (7/7 – 15/7), and Domingos PEDRO (7/7 – 15/7), Filomena VAZ-VELHO (Team leader, 17/7 – 10/8), António BARRADAS (17/7 – 10/8), Henriette LUTUBA NSILULU (17/7 – 10/8) and Pedro Panzo (17/7 – 10/8) .

From CIP, Benguela:

Antonio BUCO (7/7 – 15/7) and Enoque CANGANJO (7/7 – 10/8).

From CIP, Namibe:

Quilanda FIDEL (17/7- 10/8)
Eridson SAQUENIA (17/7- 10/8)

From , R.D. Congo:

Matthieu MONGOLU (7/7 – 10/7).

From NatMIRC, Namibia:

Martha UUMATI (17/7 – 10/8).

From IMR, Bergen:

Jens-Otto KRAKSTAD (Cruise leader, 7/7 - 15/7), Thor Egil JOHANSSON (7/7 – 10/8), Ole Sverre FOSSHØIM (7/7 – 10/8), Frank SPETLAND (7/7 – 15/7) Bjoern Erik AXELSEN (Cruise leader, (17/7 – 10/8), Magne OLSEN (17/7 – 10/8) and Hilkka NDJAULA (17/7 – 10/8)

1.3 Narrative

The vessel departed Pointe Noire 7th July at 13:30 UTC and steamed north to the border between Gabon and Congo where the survey started at 18:22 UTC the same day. The survey area was divided into four regions:

- (a) Congo - Cabinda (4° - 5° S);
- (b) Congo River - North of Pta. das Palmerinhas (6° - 9° S): ANGOLA NORTH;
- (c) the region between 9° S and 13° S: ANGOLA CENTRAL;
- (d) the region limited by the parallel of 13° S and Cunene River ($17^{\circ}15'$ S): ANGOLA SOUTH.

The entire survey was covered in two legs; the first leg started in Pointe Noire and covered the survey area up to Ambriz whilst the second leg covered the rest of the survey area.

A systematic survey track implemented in 2002 with equally spaced transect lines perpendicular to the coast was followed for the duration of the survey in the above-mentioned region. In the Cabinda region, irregular transect distance was necessary due to density of oil platforms in the area. The rest of the surveyed area in Angola was covered with 7 nautical miles (NM) spaced transects perpendicular to the coast.

The acoustic transects generally covered a depth range of 20 - 500 m. At certain areas in the central region surveying was stopped at about 50 m depth due to extreme steepness of the shelf. The shallowest part of the shelf between N'zeto and the Congo River was partly inaccessible for trawling due to oil platforms and well therefore this region was only partly covered. On 14th July at 08:00 UTC the vessel docked in Luanda for crew and scientists change and departed on 17th July at 17:30 UTC. The vessel steamed to Ambriz to complete the cover of the northern region. Due to sickness of some crew members, the vessel called on Luanda for about 6 hours, the 23rd of July. The coverage of the Central region was completed on the 1st of August at 02:31 UTC. The vessel reached the Cunene River (17°15'S), end of the southern region, on 10th August at 05:00 UTC thus completed the Angolan survey.

Calibration of the Simrad ER 60 Scientific echosounder (18, 38, 120, 200 kHz transducers) was done in Baía dos Elefantes on 1st August.

In the southern region, due to bad weather conditions the transducer keel was lowered and at times the vessel anchored waiting for calmer weather to reduce losses of acoustic signals. However, during the anchor period target strength measurements were recorded which formed part of the target strength measurements done on 18th, 28th July and 16th of August.

CTD sections that have been covered routinely over the past few years are included in the new, standardized survey grid. ADCP (Acoustic Doppler Current Profiler) recordings were logged continuously along the survey track. Additional CTD stations were added on most transects at bottom depths 50, 100 and 200m. Samples of phytoplankton were collected on selected CTD stations during daytime. Zooplankton samples were obtained using *Hydrobios Multinet* plankton sampler near selected CTD locations.

1.4 Survey effort

Figure 1(a-c) shows the cruise tracks with fishing, plankton and hydrographic stations for the Cabinda and northern region, central and southern regions of Angola. The sampling trawls, including the small and the mid-sized (15 m vertical opening) pelagic trawls and the demersal trawl (5 m), were used during the survey. Table 1 summarizes the survey effort by regions.

Table 1. Summary of survey effort by regions, including number of demersal (BT) and pelagic (PT) trawl hauls, CTD casts, Multinet stations (2-5 zooplankton samples per station) and distance surveyed (log).

Area	BT	PT	Total Trawls	CTD casts	Multinet stations	Log (NM)
Cabinda - Congo	0	3	3	23	1	465.0
Pta. Palmerinhas - Congo River	5	12	17	82	17	1858.4
Benguela - Pta. Palmerinhas	15	30	45	85	24	896.0
Cunene River - Benguela	13	15	28	73	1	1052.3
Total	33	60	93	263	43	4271.7

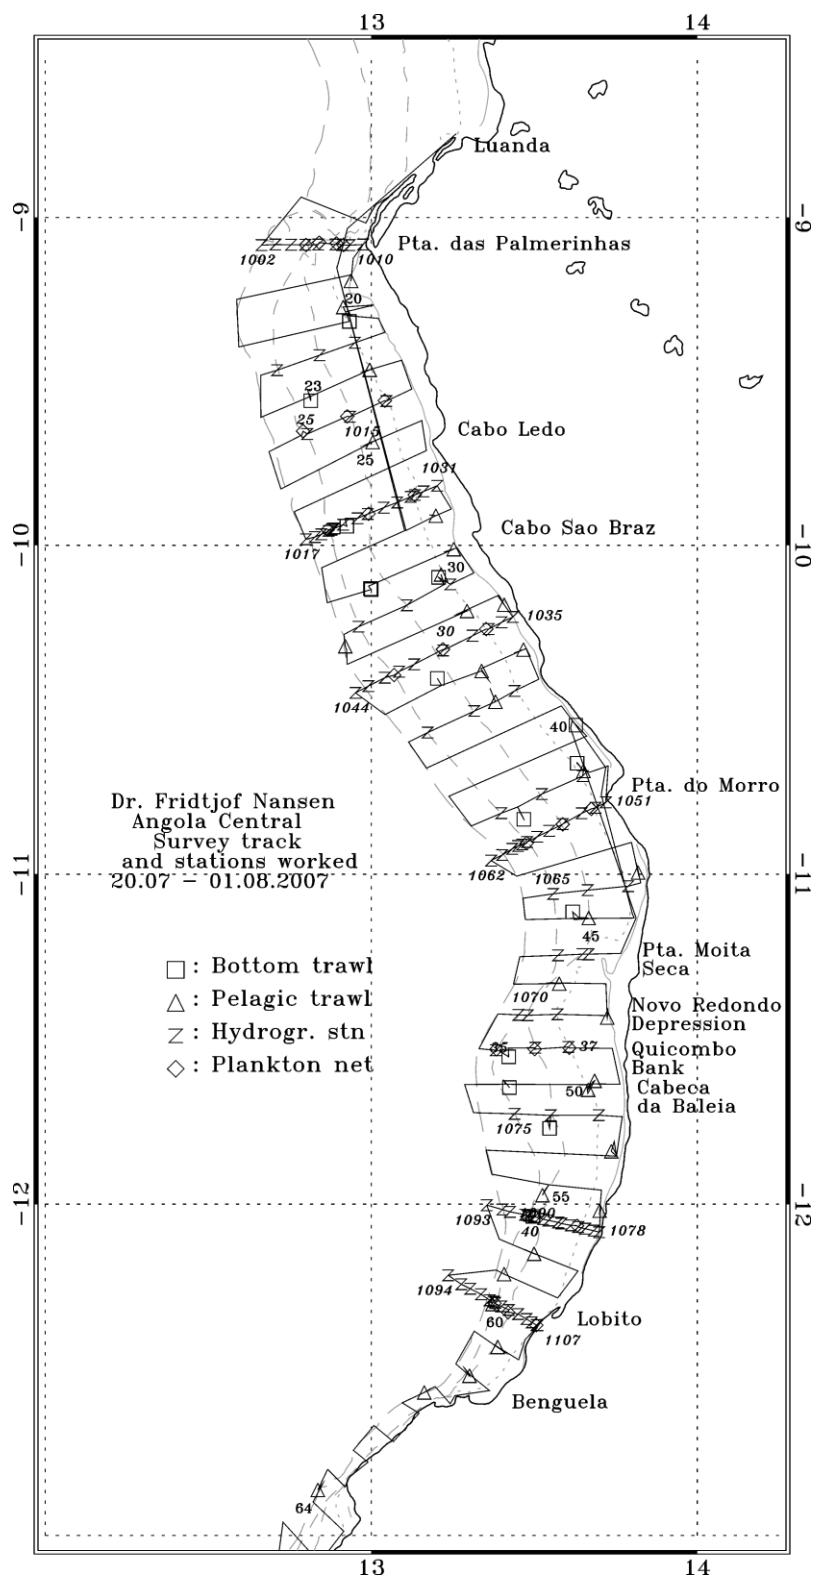

Figure 1b. Course track with fishing, plankton and hydrographic stations, Benguela -Pta. das Palmerinhas. Depth contours at 20, 50, 100, 200, and 500m.

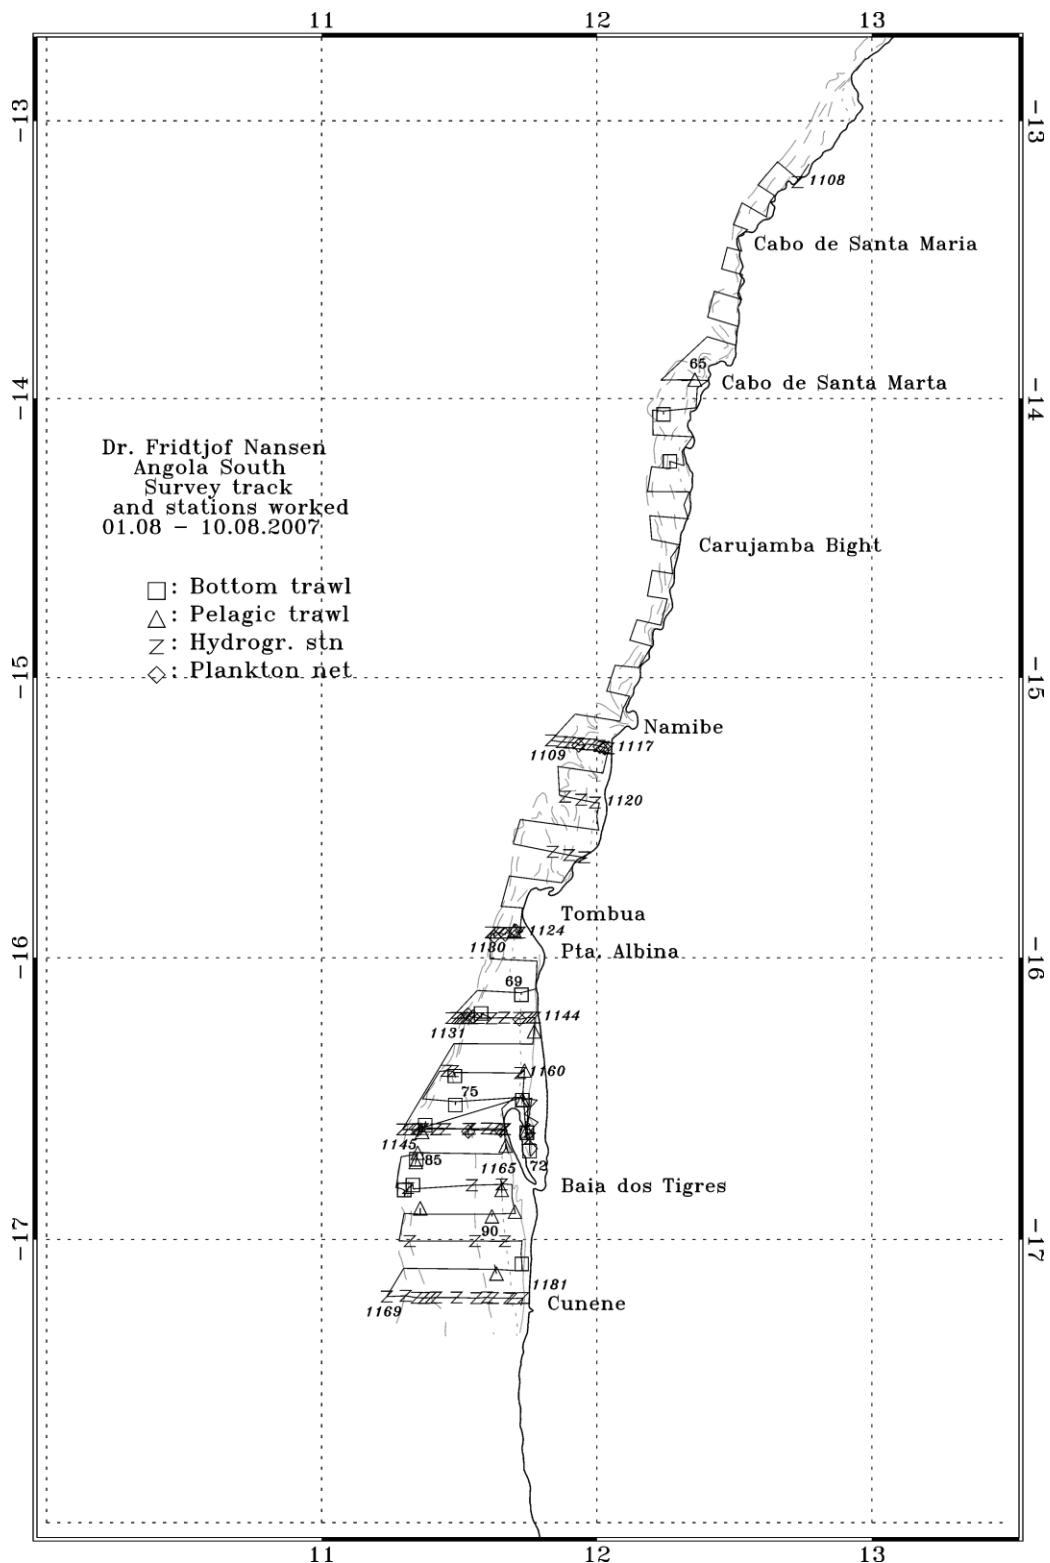

Figure 1c. Course track with fishing, plankton and hydrographic stations, Cunene-Benguela. Depth contours at 10, 20, 50, 100, 200 and 500m.

CHAPTER 2 METHODS

2.1 Hydrographic sampling

A Seabird 911+ CTD probe was used to obtain vertical profiles of the temperature, salinity and oxygen. Real time logging was carried out using the PC based Seabird Seasave software. CTD casts were conducted along the cruise track in transects at about 20 NM distance, and *ad hoc* as deemed necessary. The casts were stopped a few meters above the bottom, and at a maximum of 500 m depth.

Measurements were carried out on CTD stations and selected transects only, using the hull-borne Acoustic Doppler Profiler (ADCP). The ADCP was set to ping every 8 seconds, the depth bins were set to 8 m and the number of bins was 40. Data were averaged at 300 seconds intervals and stored on an IBM compatible PC using Transect v. 2.70 software.

Meteorological data logged from the Aanderaa meteorological station included wind direction and speed, air temperature, incident solar intensity and sea surface temperature (SST). All data were averaged by unit distance sailed (1 NM).

Continuous data on sea surface salinity (SSS) were recorded using a thermosalinograph SBE 21 Seacat.

2.2 Fish sampling

A brief description of the fishing gear is provided in Annex I. All trawl catches were sampled for species composition by weights and numbers. Records of catch rates are given in Annex II. Total length (TL) frequencies were taken for the commercial pelagic species such as sardinella, horse mackerel, sardine, round herring, anchovy, *Brachydeuterus auritus* and demersal species mainly dentex. Considering the ecosystem approach for sustainable management of marine resources, and the reported effects of jellyfish increases in other regions especially in the northern Benguela Current region, jellyfish measurements were introduced as part of the sampling routines.

Biological samples were obtained for sardinellas and horse mackerel. Total length (TL) and body weight were determined to the nearest 1 cm and 1 g below, respectively. Sex and reproductive stages were determined by means of macroscopic examination, scoring each fish according to the five-point classification scale first proposed by Holden and Raitt (1974) (Table 2).

Table 2. The five-point gonad maturity scale proposed for partial spawners by Holden and Raitt (1974). Additional information specific for Cunene horse mackerel (*Trachurus trecae*) as described by Dr. Isabel Afonso Dias during the 2001 survey are included (***bold Italic***)

Stage	Maturity status	Description
I	Immature	Ovary and testis lengths about 1/rd of body cavity length. Ovaries pinkish, translucent; testis whitish. Ova not visible to the naked eye. <i>Ovary and testis quite narrow and have a tubular shape.</i>
II	Maturing virgin and recovering spent	Ovary and testis about ½ length of body cavity length. Ovary pinkish, translucent; testis whitish, more or less symmetrical. Ova not visible to the naked eye. <i>Ovary more opaque; small specks make gonad appear more granular. Testes develop lobules, hence losing the tubular shape. Some recovering spent ovaries have conspicuous blood vessels.</i>
III	Ripening	Ovary and testis about 2/3rds length of body cavity length. Ovary pinkish-yellow colour with granular appearance, testis whitish to creamy. No transparent ova visible. <i>Milt can be seen inside testes when cut. Ovaries granular due to the presence of opaque oocytes. First time spawners have very swollen gonads. Ovaries that have spawned once lose consistency, but maintain the external appearance typical for this stage.</i>
IV	Ripe	Ovary and testis from 2/3rds to full length of body cavity. Ovary orange-pink in colour with conspicuous superficial blood vessels. Large transparent, ripe ova visible. Testis whitish to creamy, soft. <i>Ovaries jelly-like due to the presence of translucent oocytes. Gonads extrude oocytes or milt when gently pressed.</i>
V	Spent	Ovary and testis shrunken to about ½ length of body cavity. Walls loose. Ovary may contain remnants of disintegrating opaque and ripe ova, darkened or translucent. Testis bloodshot and slack. <i>Testes may have sperm remaining in the seminal duct. Pinkish areas appear in the periphery of the testes. Ovaries bloodshot and slack.</i>

Stomach samples of horse mackerel were collected for further analysis at INIP, Luanda. Feeding biology will be investigated in more detail at a later stage by relating the stomach contents to recorded availability of zooplankton. Gonads and otoliths were collected for *ad-hoc* examination.

2.3 Plankton sampling

Zooplankton

The zooplankton sampling was conducted by means of HYDROBIOS Multinet, at three depths, 50, 100 and 200 m, at predetermined positions along the survey track. The nets (405 µm) were fitted with a flowmeter to estimate sample volume. A SCANMAR depth sensor gave real-time information of the depth. The nets were opened and closed remotely from the bridge of the vessel. The samples were preserved in formalin 4%.

2.4 Acoustic sampling

Acoustic equipment

Acoustic data were recorded using a Simrad ER60 scientific echosounder equipped with keel-mounted transducers at nominal operating frequencies of 18, 38, 120 and 200 kHz. Few locations along the Angolan coast are favourable for transceiver calibration (essentially Baía dos Tigres and Baía dos Elefantes), and the survey was therefore started without *a priori* calibration. All transceivers were calibrated in Baía dos Elefantes the 1th of August.

Acoustic data were logged and post-processed using the latest acoustic data post-processing software, the Large Scale Survey System (LSSS) Version 1.13, which replaced the old BEI post-processing software that has been used on the vessel since 1990. The technical specifications and operational settings of the echosounders used during the survey are given in Annex IV.

Allocation of acoustic energy to species group

The acoustic data were scrutinized using the LSSS. Scatterers were displayed at 38 kHz. The mean 5 NM area backscattering coefficient s_A (m^2/NM^2) was allocated to a predefined set of species groups on the basis established echogram features. Acoustic groups and respective species are listed in Table 3. Ground truthing and estimation of mean length and weight were accomplished by means of targeted pelagic and demersal trawling.

Table 3. Allocation of acoustic densities to species groups. Note that for the groups sardinella, horse mackerel, big-eye grunt and pilchard all encountered species are listed, while only examples are listed for the remaining groups.

Group	Taxon	Species
Sardinella	<i>Sardinella</i> sp.	<i>S. aurita</i> <i>S. maderensis</i>
Horse mackerel	<i>Trachurus</i> sp.	<i>T. trecae</i> <i>T. trachurus capensis</i>
Pilchard	<i>Sardinops</i>	<i>S. ocellatus</i>
Big-eye grunt		<i>Brachydeuterus auritus</i>
Pelagic species 1	Clupeiformes ₁	<i>Ilisha Africana</i> <i>Etrumeus whiteheadi</i> <i>Engraulis encrasicolus</i>
Pelagic species 2	Carangidae ₂	<i>Selene dorsalis</i> <i>Chloroscombrus chrysurus</i> <i>Decapterus rhonchus</i> <i>Seriola carpenteri</i> <i>Axius thazard</i> <i>Sarda sarda</i> <i>Scomber japonicus</i> <i>Sphyraena guachancho</i> <i>Trichiurus lepturus</i> <i>Lepidopus caudatus</i>
Other demersal species	Sparidae ₃	<i>Dentex angolensis</i> <i>D. macrophthalmus</i> <i>D. congoensis</i> <i>D. canariensis</i> <i>D. barnardi</i> <i>Pagellus bellottii</i> <i>Sparus caeruleostictus</i> <i>S. pagrus africanus</i> <i>Saurida brasiliensis</i> <i>Arioma bondi</i> <i>Pomadasys incisus</i> <i>Galeoides decadactylus</i>
Mesopelagic species	Myctophidae ₃	<i>Diaphus dumeleri</i>
	Other mesopelagic fish	<i>Trachinocephalus myops</i>
Plankton	Calanoidae	<i>Calanus</i> sp.
	Euphausiidae	<i>Meganyctiphanes</i> sp.
	Other plankton	

₁: other than *Sardinops* sp.; ₂: other than *Trachurus* sp.; ₃: main taxon in group.

Estimation of biomass

The target strength (TS) function used to convert mean area backscattering coefficient s_A (m^2/NM^2) at 38 kHz to number of fish corresponds to:

$$\text{TS} = 20 \log L - 72 \text{ (dB)} \quad (1)$$

or

$$C_F = \frac{10^{7.2}}{4\pi} \cdot L^{-2} \quad (2)$$

where C_F is the conversion factor from acoustic density to fish biomass and L is the mean total fish length. This target strength function was originally established for North Sea herring, but has later been attributed to clupeids in general (Foote *et al.*, 1986; Foote, 1987).

No specific target strength relations presently are available for the species at hand, and equation (2) has therefore been applied consequently for all targeted species in this time series. The biomass was calculated by multiplying the number of fish by the expected length at weight, estimated by regressing the log-length (total) against total weight. Separate length-weight relationships were worked for each region (north, central, south), pooling all data within each region.

The boundaries of encountered fish aggregations (post strata) were determined by means of contouring within the inner and outer zero-value limits of the transect lines. The strata contours were digitised using Golden Software Didger software Version 3.0.7. Distribution plots and area calculations on the strata were carried out using IDL 6.1 for MS Windows. Sub-stratification was used to isolate areas of similar densities, using the following pre-defined, standard categories: 1: $s_A = 0-300$; 2: $s_A = 301-1\ 000$; 3: $s_A = 1\ 001-3\ 000$; 4: $s_A > 3\ 001$ (m^2/NM^2).

Mean 5-NM integrator values (s_A) computed along the transect lines were re-averaged for each stratum. The short spacing between the lines (7 NM) makes it impossible to exclude all between-transect values without removing some on-line contributions, particularly for sardinella on the inner shelf. The potential positive bias of including between-line values is likely smaller than the negative bias that would have been introduced by excluding high on-line contributions. This bias is also counteracted by the shallow distribution pattern (partly above the integration limit) and vessel avoidance behaviour of sardinella (Misund and Aglen, 1992). All estimates should consequently be considered as relative indices of abundance.

The overall length frequency distributions within strata were estimated by weighting the sample-distributions with the nearest valid 5 NM integrator value, or the average of two adjacent values. Target species of the same genus, i.e. *S. aurita* / *S. maderensis* and *T. trecae* / *T. trachurus capensis*, are not acoustically distinguishable, and the s_A values were therefore split according to the relative distributions of the two species in each length group. The total number of fish in each length group was estimated as:

$$\rho_i = \frac{\langle s_A \rangle t_{i,j} \cdot u_i}{\sum_i \frac{u_i}{C_{Fi}}} \cdot A_s = \frac{10^{7.2} \cdot t_{i,j} \cdot u_i \cdot \langle s_A \rangle \cdot A_s}{4\pi \sum_i u_i \cdot (L_i + 0.5)^2} \quad (3)$$

where:

ρ_i	=	estimated number of fish in length group i
$\langle s_A \rangle$	=	mean recorded area backscattering coefficient (m^2/NM^2)
$t_{i,j}$	=	proportion of species j in length group i
u_i	=	proportion of sampled fish in length group i
A_s	=	horizontal area of stratum s
C_{Fi}	=	conversion factor for length group i
L_i	=	length group i (nearest full cm below total length)
$L_i+0.5$	=	mean length in L_i .

CHAPTER 3 OCEANOGRAPHIC CONDITIONS

3.1 Surface distribution

Northern Cabinda and the northern region

The wind observed in this region during this survey was moderate, with an average velocity of around 10 knots (5m/s) (Figure 2a). The dominant direction was from the south and southwest. Between N'zeto and Cabeça de Cobra the predominantly wind was southerly (blowing northward) off Cabeça de Cobra and south-westerly off N'zeto and the wind speed increased at about 20 knots (10m/s). South N'Zeto and between Ambriz and Luanda the average with direction became predominantly southeast near the coast and southwest off the coast with an area of wind relaxation blowing from the east north Luanda.

In the area of Cabinda the sea surface temperature ranged from 22 to 23.5 °C (Figure 3a), the isotherm of 22°C is oriented alongshore off Cabinda with a pocket of cooler water inshore at the mouth of Congo river. Lower values of salinity were found ranging from 27.0 to 34.5 (Figure 4a) due to the outflows of the Congo River moving northwards. Between Pta da Moita Seca and Cabeça de Cobra it is observed a salinity front with isolines in front line ranging from 33 to 35.5. Alongside south of Congo River mouth up to Luanda there is a presence of cooler water (21°C) with predominance of salinity value 35.5.

Central Region

In this region the wind was very variable both in strength and direction (Figure 2b). The strongest winds (around 20 knots) were registered south Benguela, between Lobito and Quicombo, near the coast of Pta do Morro and sporadically between north Pta do Morro and Pta das Palmerinhas. The predominant wind direction with the strong wind (> 10m/s) was southwest.

The surface water temperature registered higher values (+1°C) near shore than in the northern region, varying between 22° and 23°C offshore (with isotherm of 21°C in the area of Lobito) (Figure 3b). The lower values of salinity of 35.2- 35.4 found in vicinity of Pta. das Palmerinhas are due to outflows of Cuanza River (Figure 3e) The isoline of the 35.8 is oriented alongshore and pockets of salinity with a value of 35.6 are observed both around Lobito and Pta. do Morro (Figure 4b).

Southern Region

The wind in this region was stronger and with less variation regarding its direction (Figure 2c), and the dominant direction was from the south. Around Carujamba and Namibe the wind came from the south and speeds were at minimum. Three focus of strong wind were encountered: around and north Cabo de Sta. Marta with winds blowing SE, south Namibe and Tômbwa with south-westerly wind and around Baía dos Tigres and Cunene River's mouth where the wind had a more SE direction. In this later location the winds were very strong,

forcing the ship to suspend the Multinet work. The speeds registered in this area reached more than 40 knots.

The horizontal temperature (Figure 3c) registered lower values than in both previous regions, with values as low as 15° to 17°C between Baía dos Tigres and Cunene. As in the central region, the isohaline of 35.8 (Figure 4c) is orientated alongshore deflecting off Baía dos Tigres (35.6). The lowest salinity value (35.4) was found between Baía dos Tigres and Cunene River due to outflows of Cunene River.

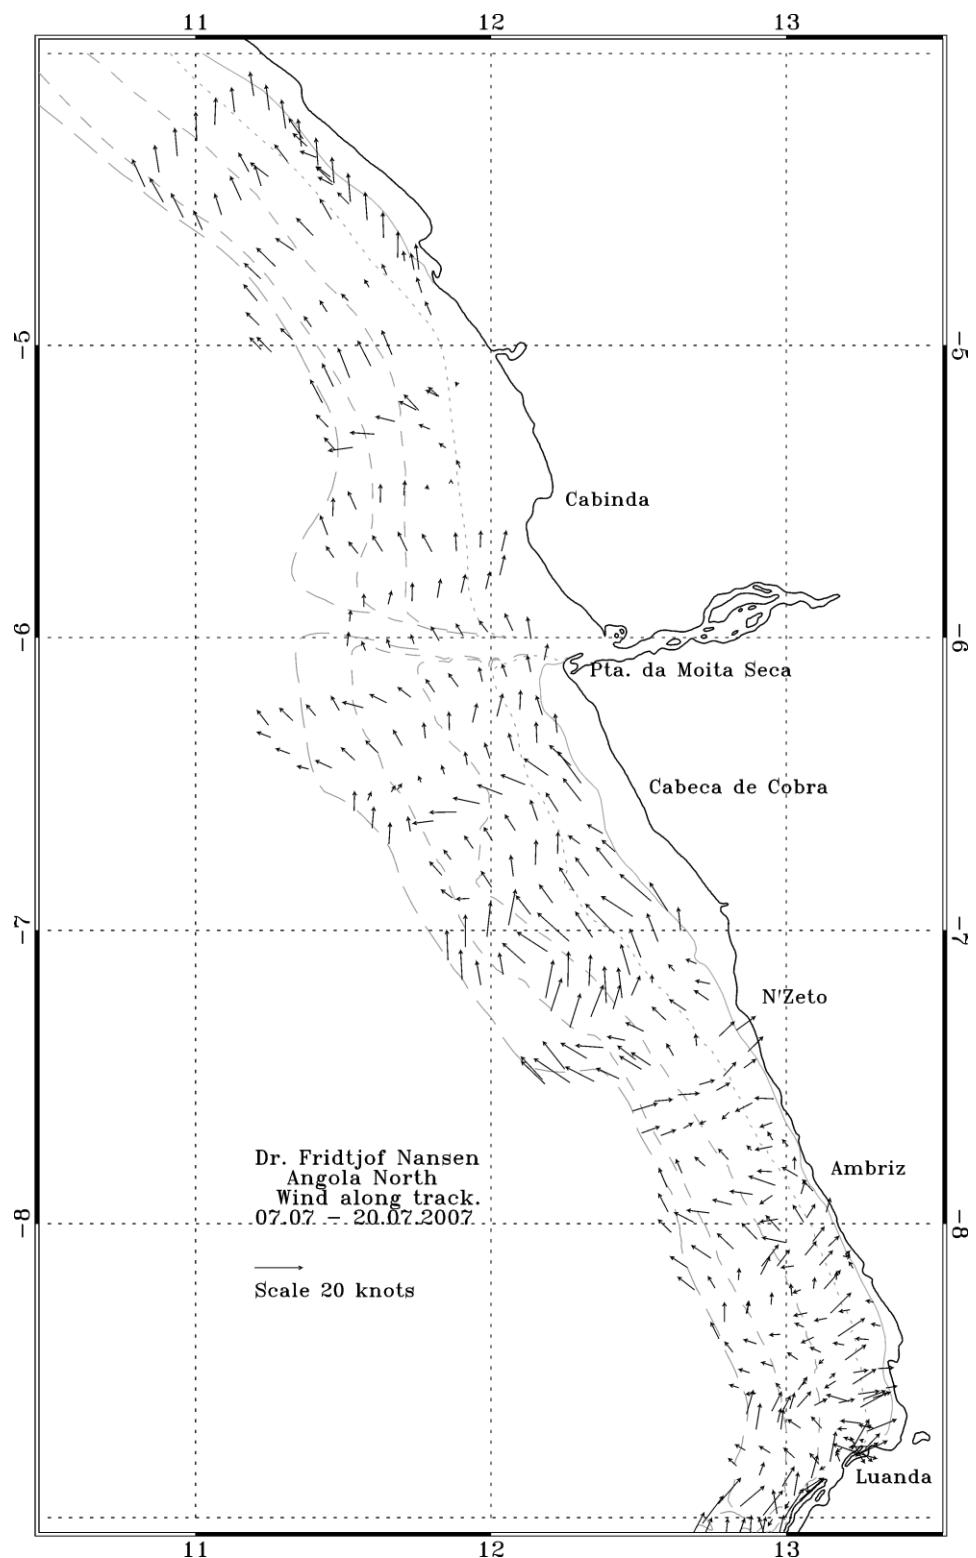

Figure 2a. Distribution of wind velocities along the survey track for the northern region, including Cabinda. Depth contours at 20, 50, 100, 200, and 500 m.

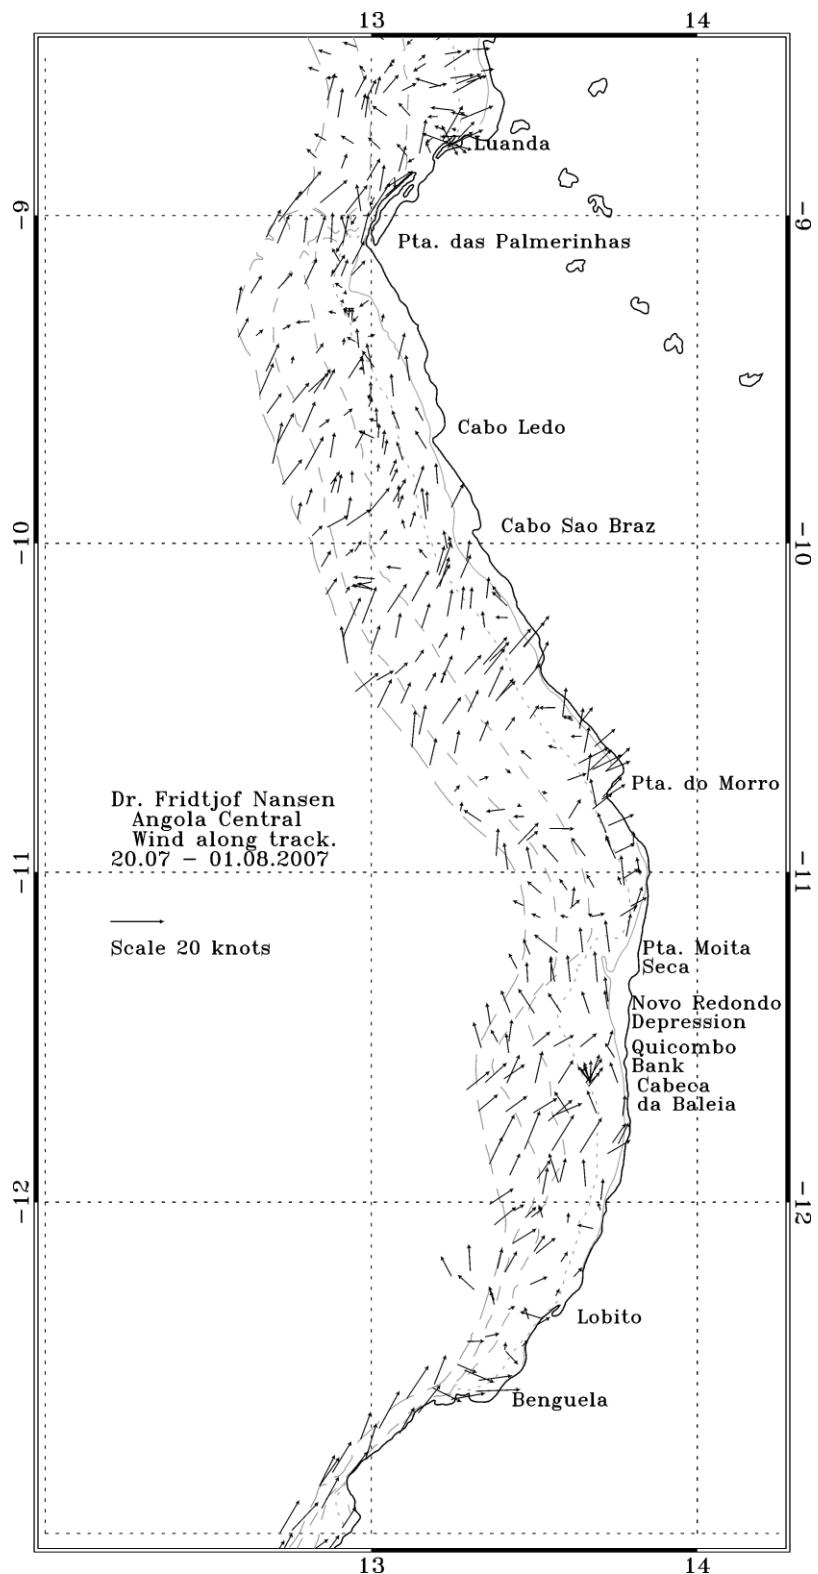

Figure 2b. Distribution of wind velocities along the survey track for the central region. Depth contours at 20, 50, 100, 200, and 500 m.

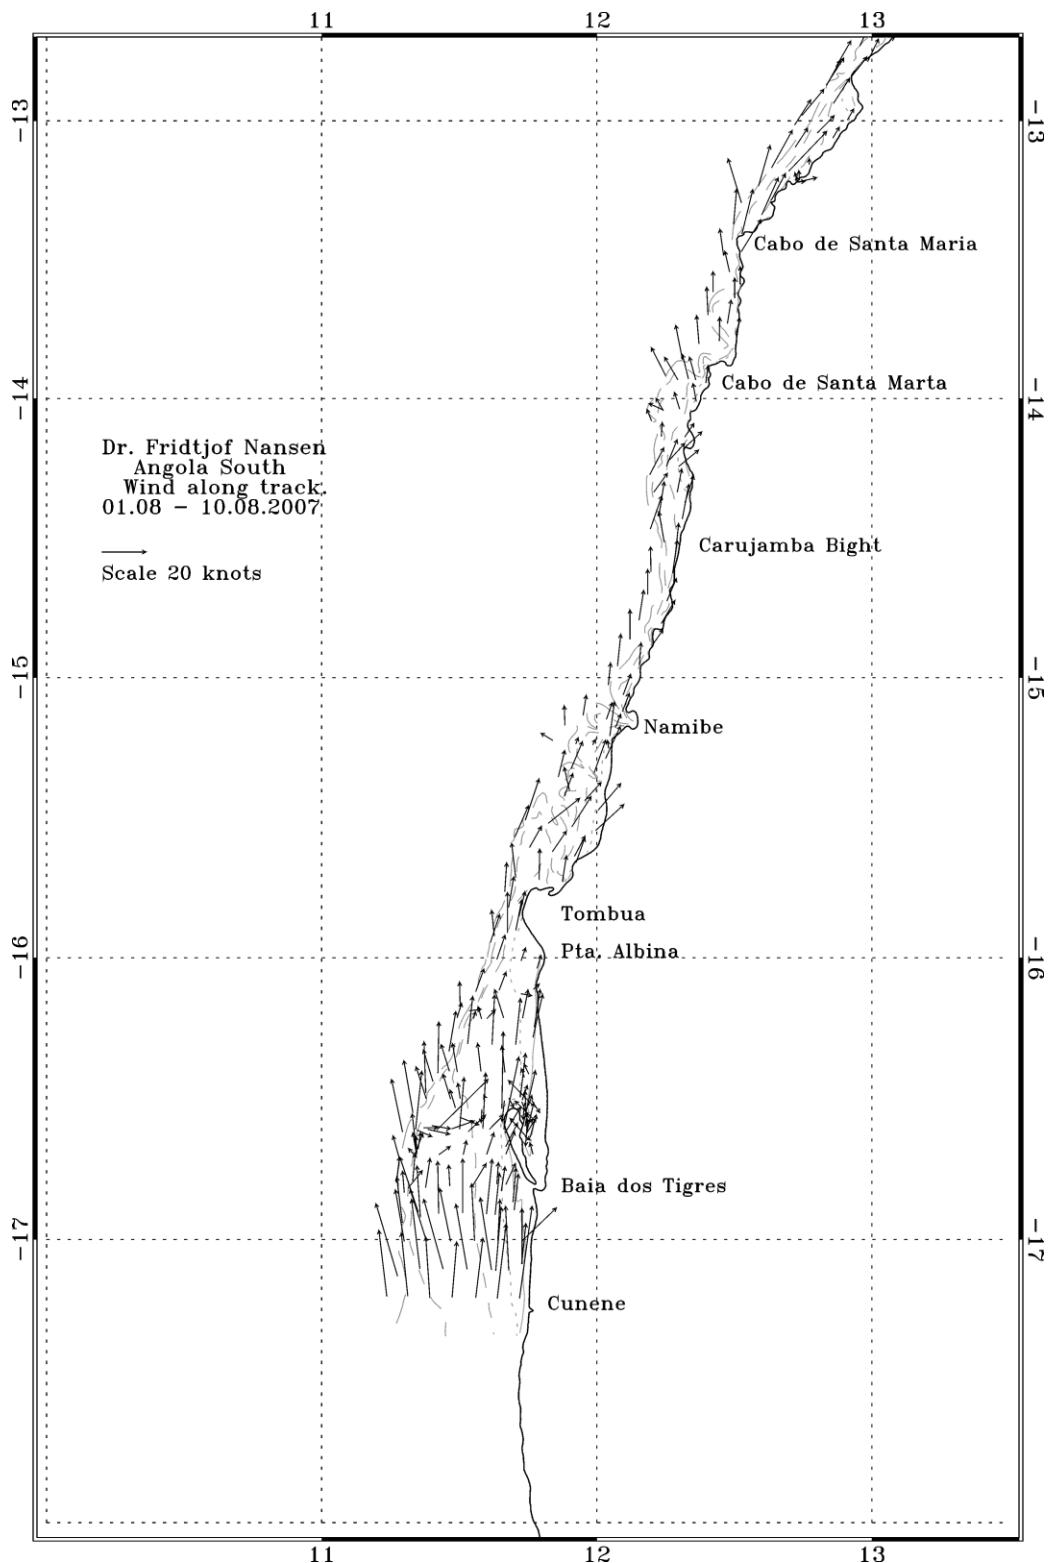

Figure 2c. Distribution of wind velocities along the survey track for the southern region. Depth contours at 10, 20, 50, 100, 200 and 500 m.

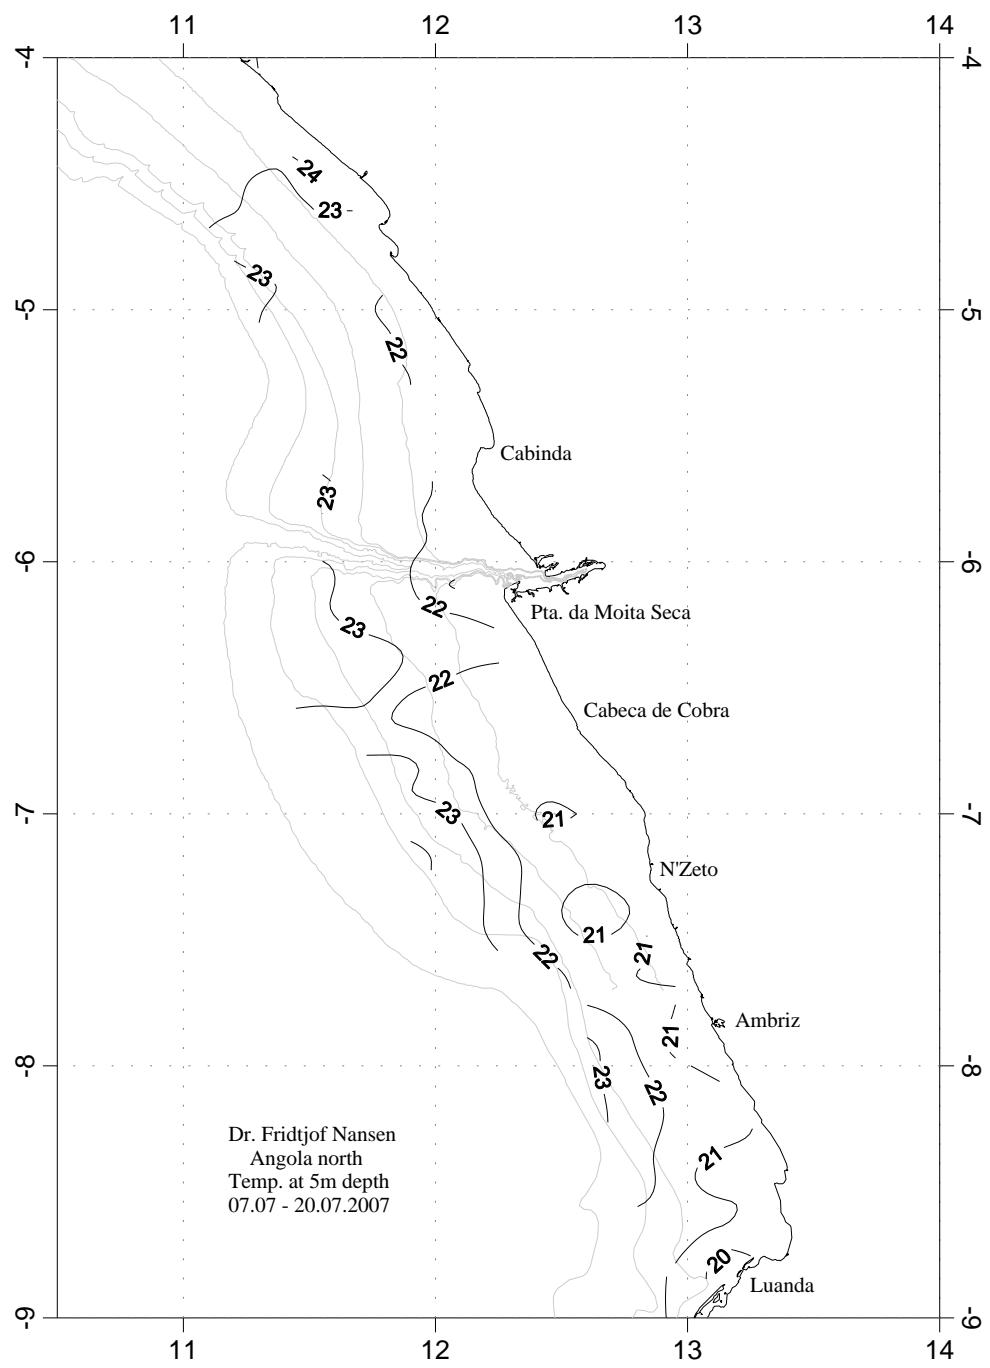

Figure 3a. Distribution of water temperatures at 5m depth in the northern region, including Cabinda. Depth contours at 20, 50, 100, 200, and 500 m.

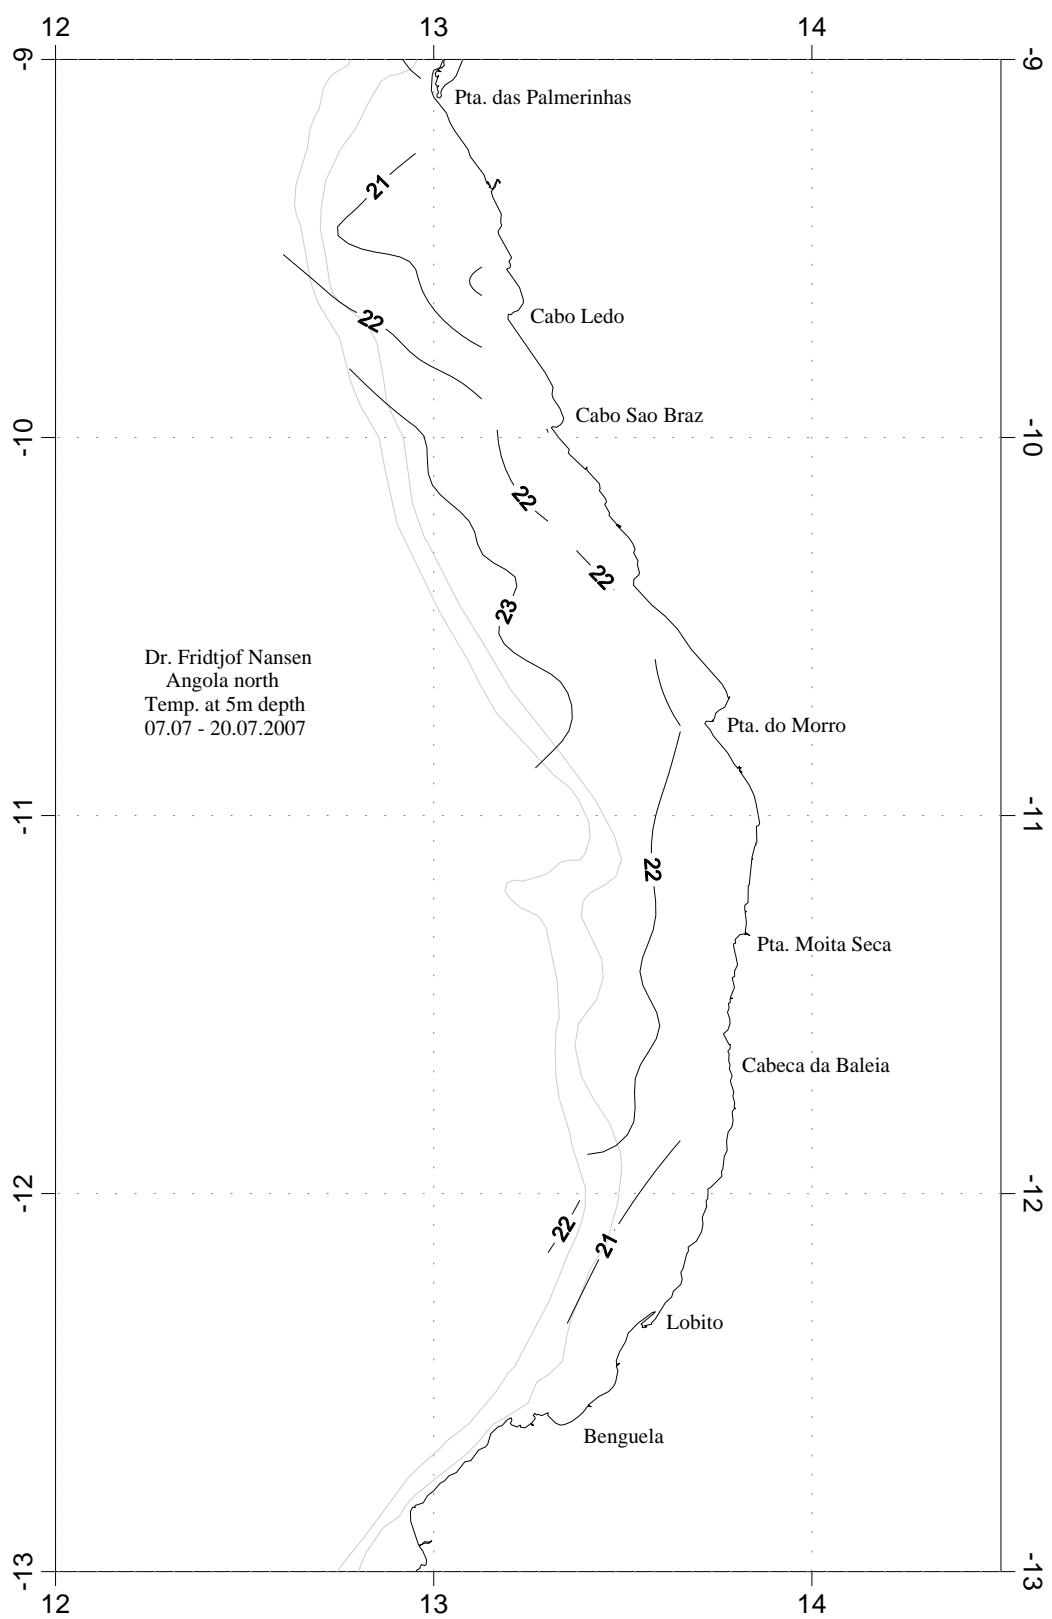

Figure 3b. Distribution of water temperatures at 5m depth in the central region. Depth contours at 20, 50, 100, 200, and 500 m.

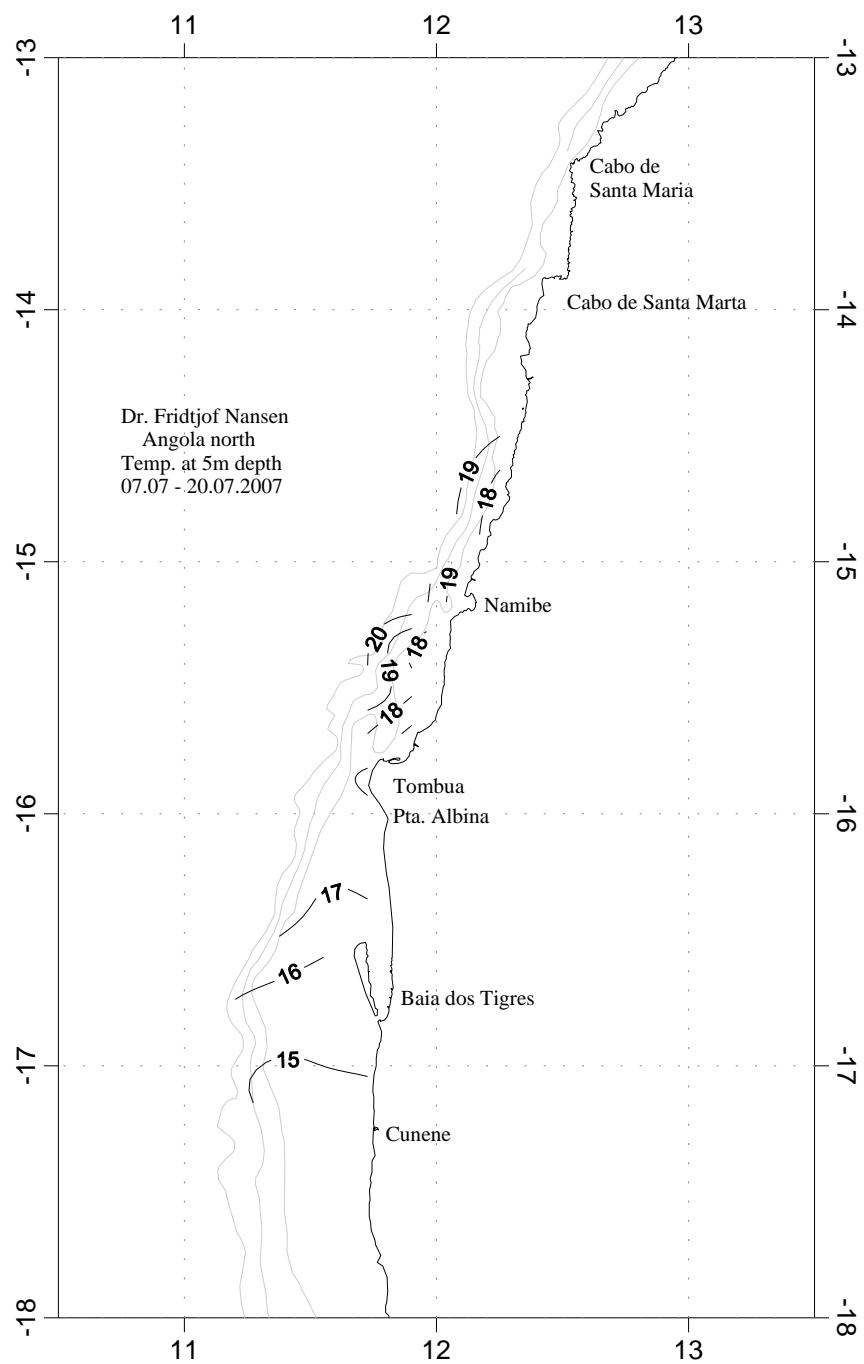

Figure 3c. Distribution of water temperatures at 5m depth in the southern region. Depth contours at 20, 50, 100, 200, and 500 m.

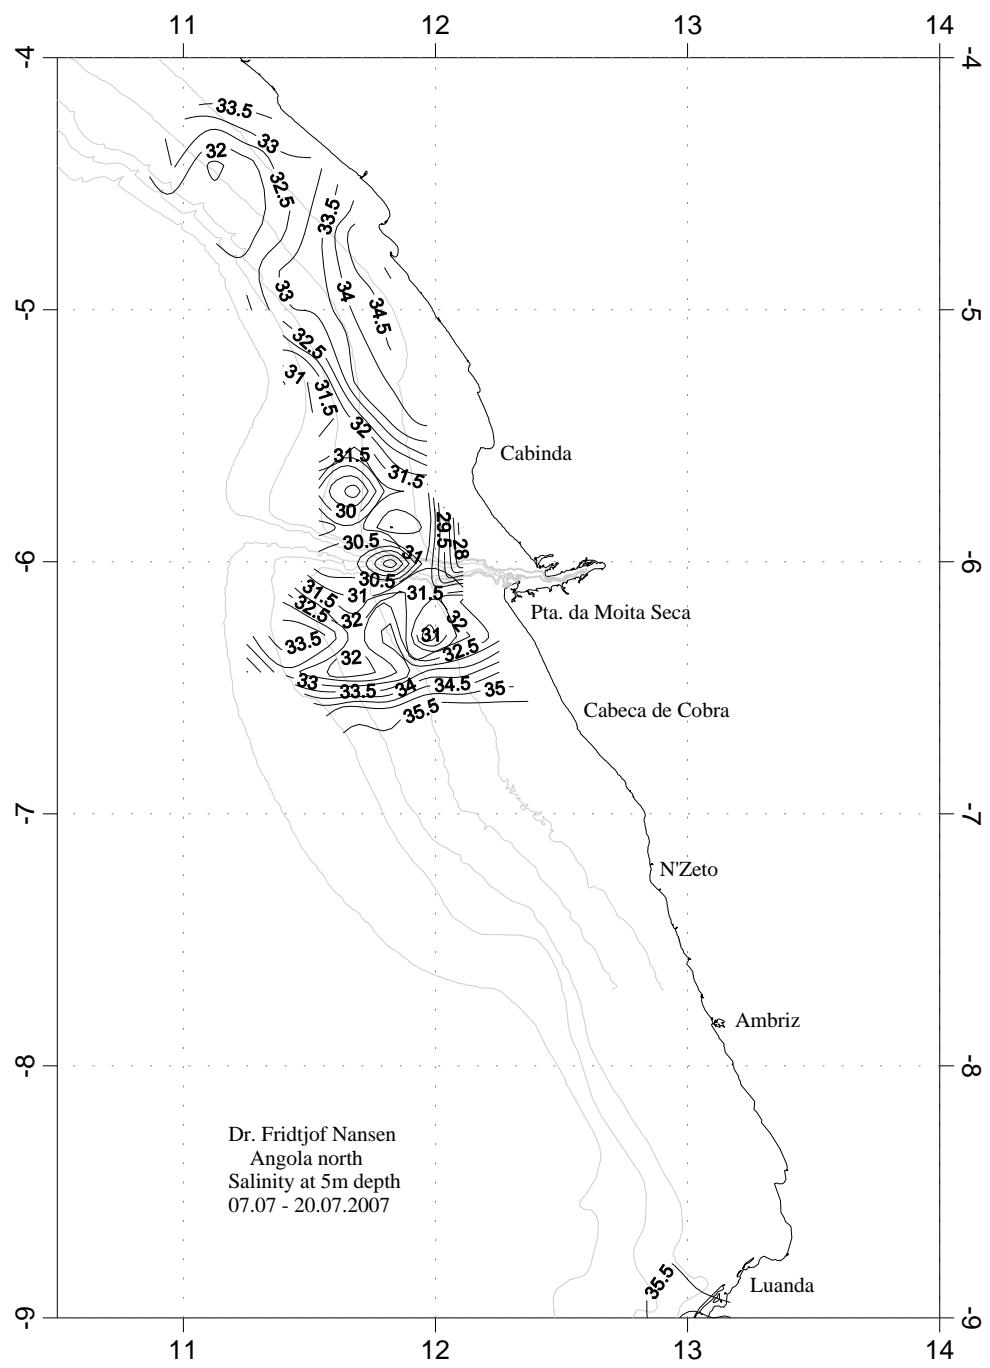

Figure 4a. Distribution of salinity at 5m depth in the northern region. Depth contours at 20, 50, 100, 200, and 500 m.

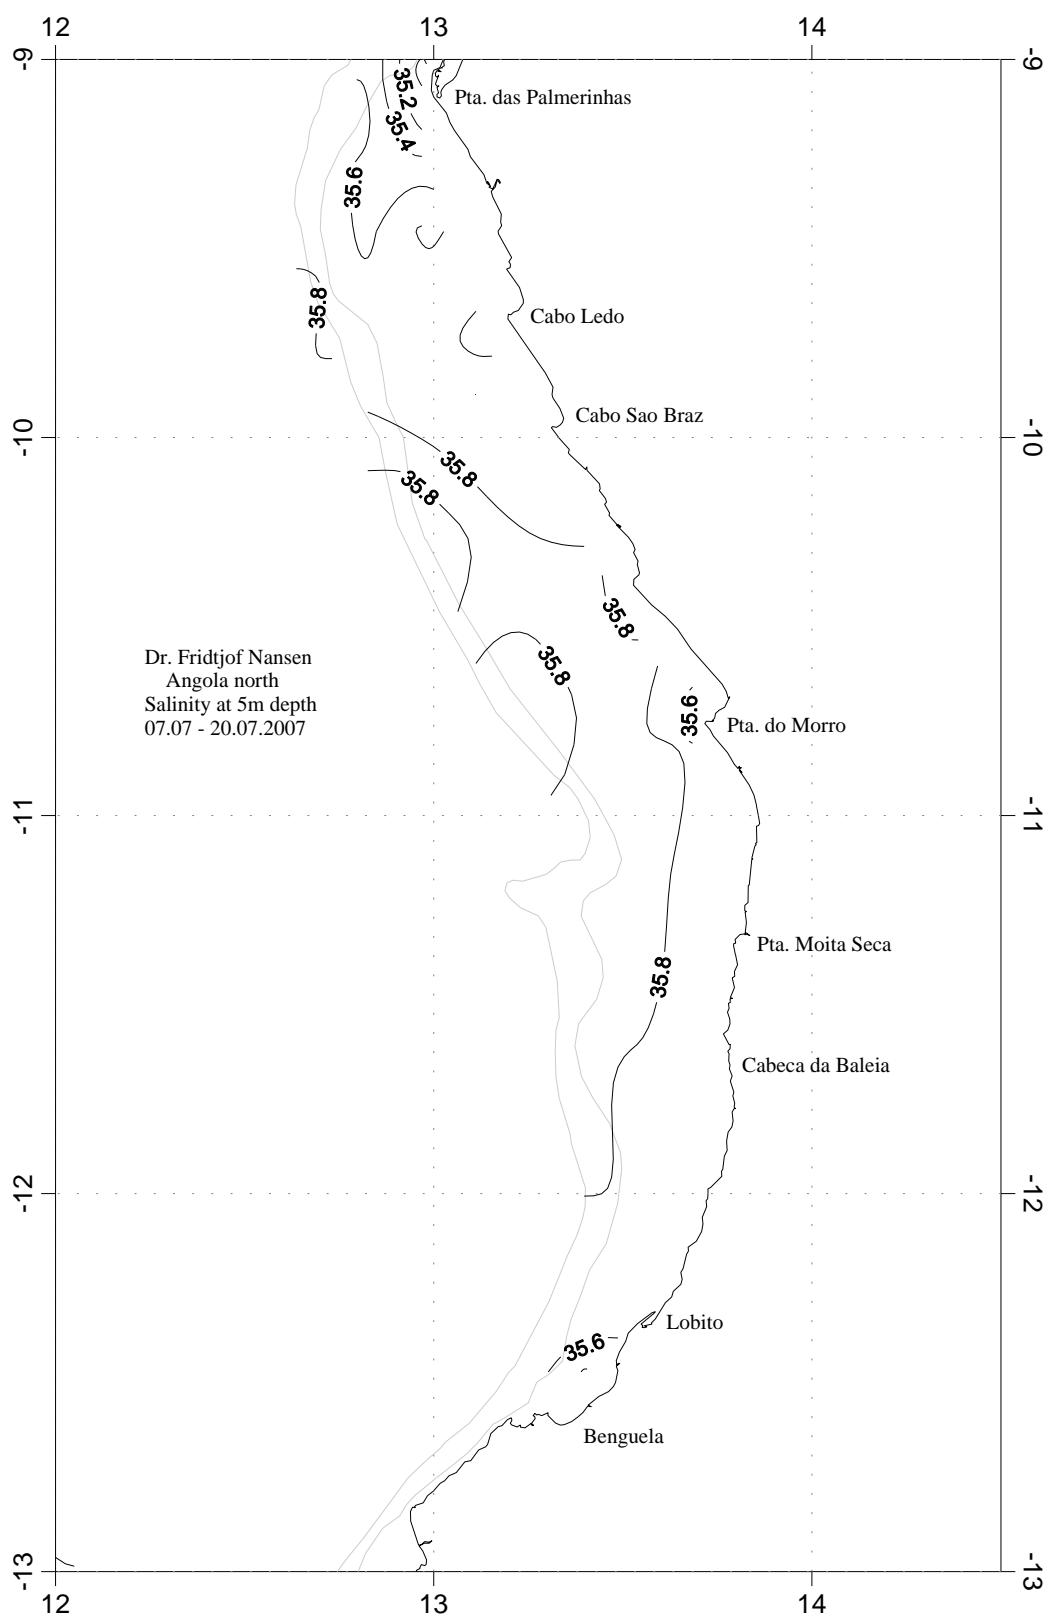

Figure 4b. Distribution of salinity at 5m depth in the central region. Depth contours at 20, 50, 100, 200, and 500m.

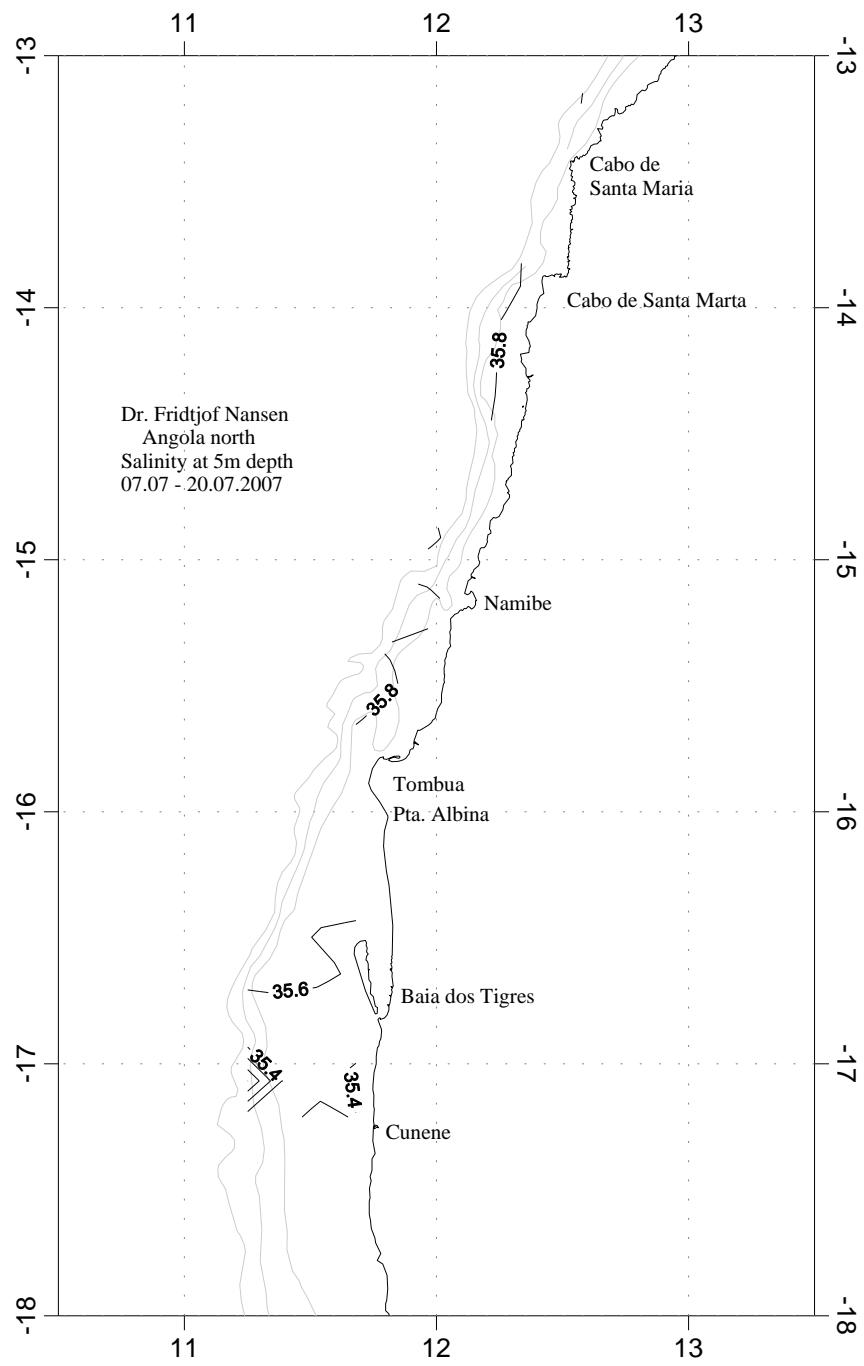

Figure 4c. Distribution of salinity at 5m depth in the southern region. Depth contours at 20, 50, 100, 200, and 500 m.

3.2 Standard sections

Section off **Pointe Noire** (Figure 5a). This section is located at the border between Congo and Angola. During the winter season the sea surface temperature is slightly high ranging from 20 to 22°C and decreases with depth. The salinity at the surface layer is about 34.2 and the oxygen content is high at the surface (4.5ml/l), while low oxygen waters (1ml/l) appear below 300 m depth.

Section off **Moita Seca** (Figure 5b). This section is located off the Congo River's mouth. Although the river discharge is reduced during these months (winter season), the plume of fresh water can be observed in the stations close to the coast and also at the station 949. At station 948 we can observe subsurface water welled up to the surface. Oxygen content is high at the surface (5ml/l), and appears to be similar to the one recorded last year in July. In this section, as in the next, the maximum temperature is found near the surface and decreases with depth.

In the sections of **N'zeto** (Figure 5c) and **Ambriz**, (Figure 5d) the distribution of the oceanographic parameters is very similar in both sections, and indicates a weak upwelling.

Section off **Pta. of Palmerinhas** (Figure 5e). At stations 1006-1010 the salinity distribution shows lower values (35.3-35.5) at the surface than the previous sections. This may be due to the outflow of the Kwanza River. The sea surface temperature is slightly high (20-21°C) and oxygen content (5ml/l) as in the previous section. From this section southward the oxygen distribution reveals an offshore minimum at about 200-400 m.

Section off **Cabo Ledo** (Figure 5f) is located south off Kwanza River's mouth. Note the appearance of high salinity (35.8) and temperature (23-22°C). The elevation of the isolines indicates an ongoing upwelling process.

Section off **Cabo São Braz** (Figure 5g). The distribution of oceanographic parameters is very similar to the previous section. There is sign of a weak upwelling in this area.

Section off **Pta. do Morro** (Figure 5h) reveals a pattern similar to that observed off Pta. Palmeirinhas: a 100 m surface layer of constant temperatures ranging from 16 to 22°C and salinity increasing offshore from 35.6 to 35.8 separated from the underlying oxygen-poor layers by a shallow pycnocline.

The Figures 5i and 5j show the vertical distributions of temperature, salinity and oxygen worked out off **Ponta do Egito** and **Lobito**. Oceanographic conditions in these two sections are very similar, with surface temperatures of 19-21°C, salinities of about 35.7-35.8 and levels of oxygen of 4-5 ml/l at the surface. There were weak signs of upwelling.

Section off **Namibe** (Figure 5k). The surface temperature shows lower values (19-20°C) than the previous sections, and gets cooler towards the coast. The layer of low oxygen (1ml/l) was found offshore around 200 m. The highest surface salinity (35.9) was found in this section.

Sections off **Pta. Albina** (Figure 5l), **Baía dos Tigres** (Figure 5m) and off **Cunene River** (Figure 5n) are located in the southern region from where we have observed lower surface temperatures than elsewhere, with values down to 14°C in the Cunene section. The influence

of Cunene River is shown in the surface salinity values (35.4). Low oxygen values appeared already below the 100-150 m off Pta Albina, Baía dos Tigres and Cunene.

CHAPTER 4 DISTRIBUTION, SIZE COMPOSITION AND BIOMASS ESTIMATES

4.1 Cabinda – Congo River (south of Pointe Noire)

Pelagic species 2 (PEL2)

We found only PEL2 in this region. This category includes members of the family Carangidae (other than *Trachurus* spp.), Scombridae, Sphyraenidae and Trichiuridae, both of shallow and deep waters. *Trichiurus lepturus* was by far the most common species caught, and it was found in a low-density-continuous distribution throughout the area up to the mouth of the Congo River ($1 < s_A < 300 \text{ m}^2/\text{NM}^2$). The biomass of PEL2 was estimated at 7 900 tons. Figure 11 shows the distribution of this group.

Several areas inside the survey region could not be accessed due to oil exploitation activities. As a consequence the area of Cabinda was only partly surveyed.

4.2 Congo River - Pta. das Palmerinhas

Sardinella

Both sardinella species, *Sardinella maderensis* and *S. aurita*, were found throughout the northern region (Figure 6). The distribution is almost continuous throughout the area. Compared with last year distribution, they were found more offshore and closer to the Congo River's mouth. We also found bigger areas of high density ($1 001 < s_A < 3 000 \text{ m}^2/\text{NM}^2$) off Cabeça de Cobra, north of N'zeto, and south of Ambriz.

Figure 7 shows the total length frequency distribution of *S. maderensis* and *S. aurita*. *S. maderensis* ranged from 5 to 34 cm in total length (TL), with two clear modal peaks at 7 and 27 cm. The juvenile cohort is mainly found north of Ambriz. The total length distribution for *S. aurita* consisted mostly of adult fish, ranging from 25 to 35 cm, and shows two moderate peaks at around 27 and 30 cm.

The estimated biomass for both sardinella species was 187 800 tons, lower than 2006 value (366 500 tons). *S. aurita* dominated the catches, contributing about 60% (107 000 tons) to the total estimated sardinella biomass. The estimated biomass for *S. maderensis* (80 800 tons) is also lower than 2006. For both species the biomass consisted of individuals larger than 25 cm TL.

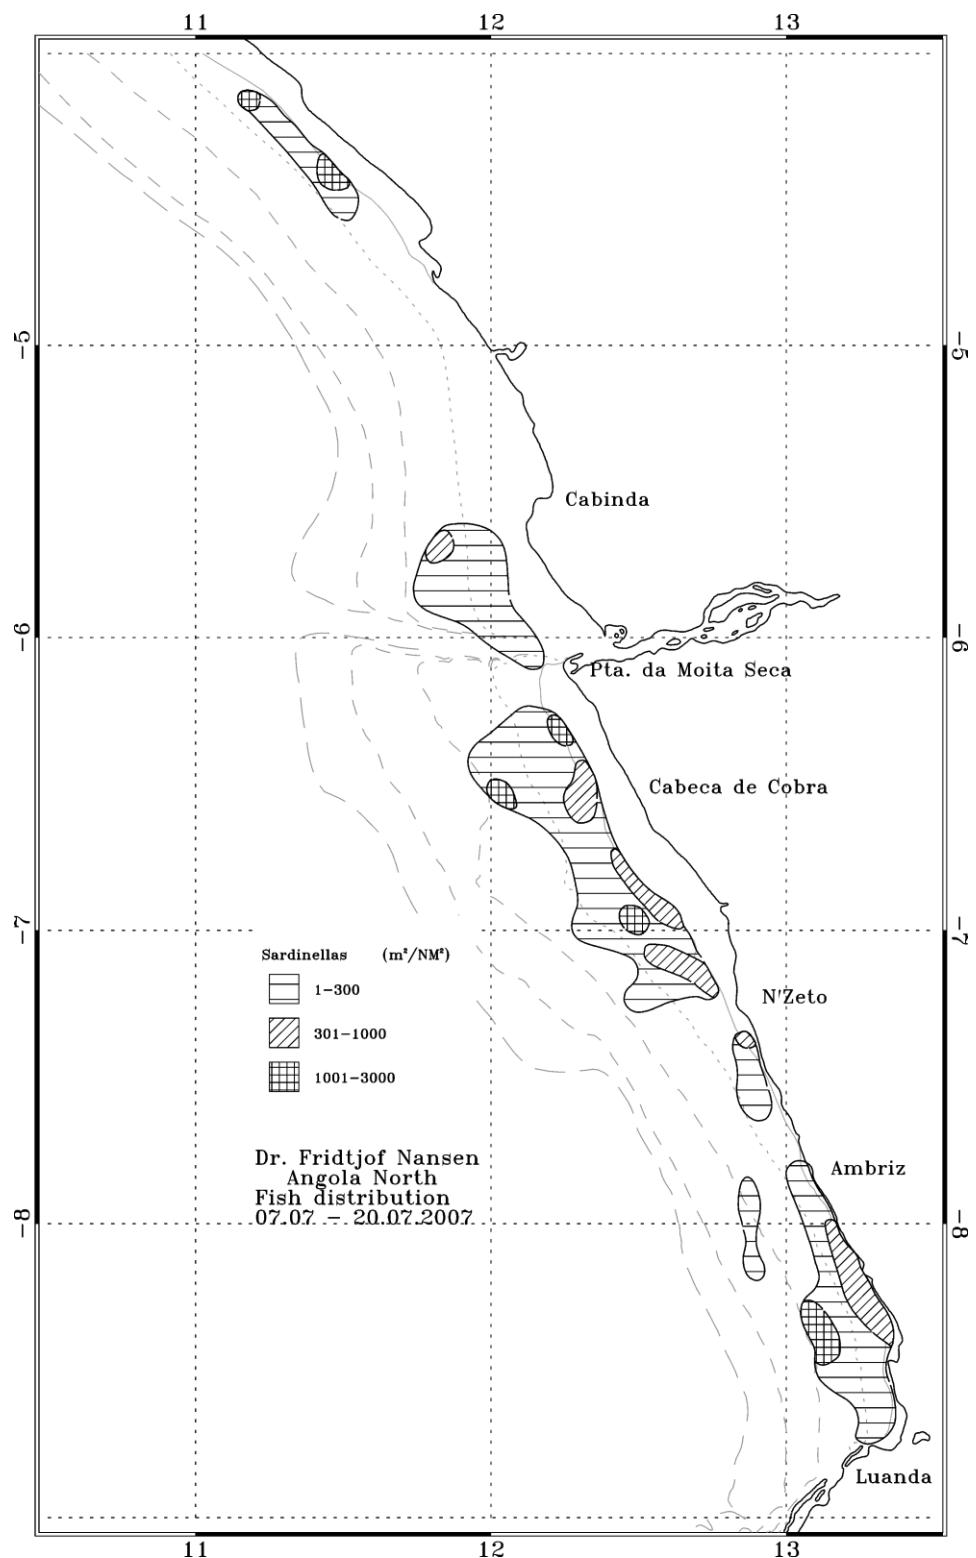

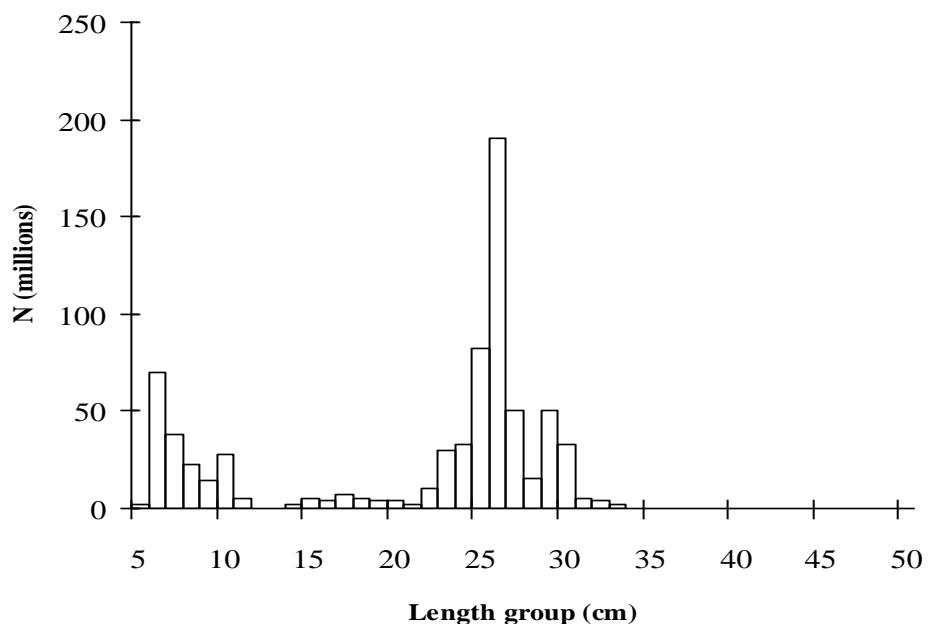

Figure 6. Distribution of *Sardinella* spp. Pta. das Palmerinhas-Congo River, including Cabinda. Depth contours at 20, 50, 100, 200, and 500 m.

a) *Sardinella maderensis*

b) *Sardinella aurita*

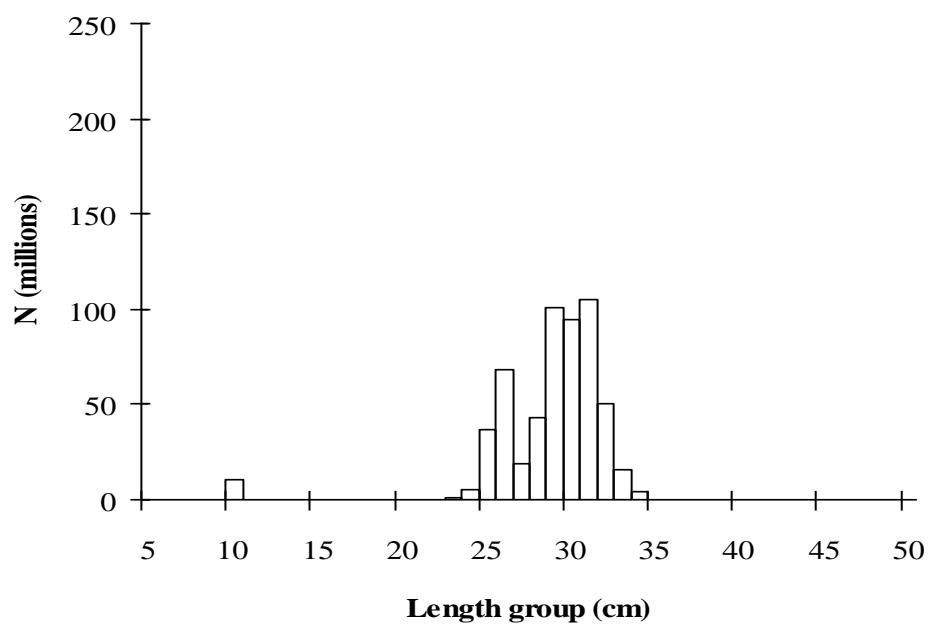

Figure 7. Total length distribution of *Sardinella maderensis* (a) and *S. aurita* (b), Pta. das Palmerinhas-Congo River.

Cunene horse mackerel

The Cunene horse mackerel, *T. trecae*, was found in low-density patches mostly with densities between $s_A < 300 \text{ m}^2/\text{NM}^2$ (Figure 8). However, south of Ambriz, a small area with a density of $s_A > 300 \text{ m}^2/\text{NM}^2$ was recorded.

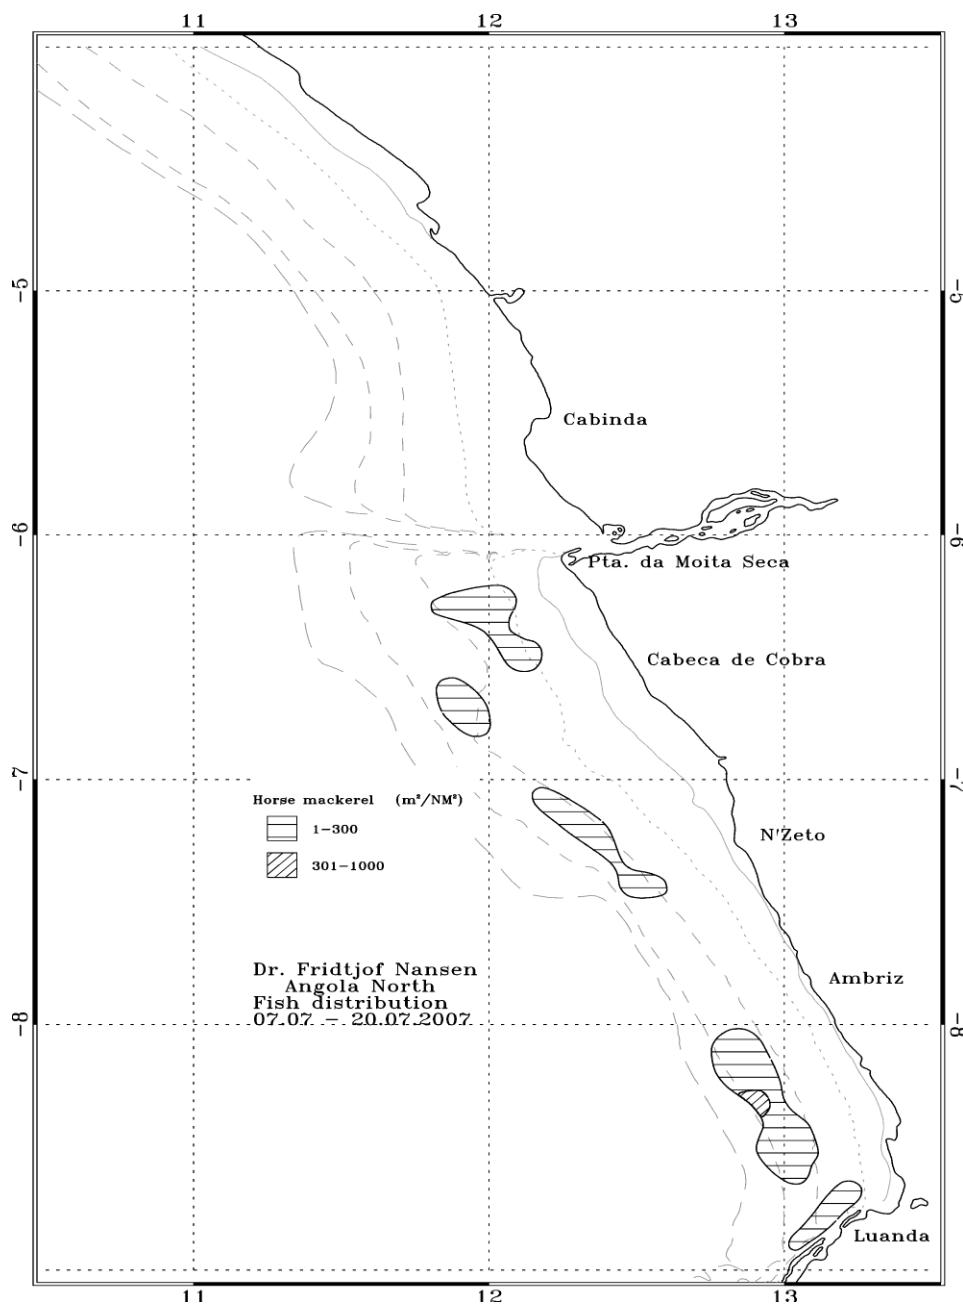

Figure 8 Distribution of Cunene horse mackerel, north region. Depth contours at 20, 50, 100 and 500 m.

The distribution shows two well-defined cohorts at 15 cm and 37 cm (TL) with the younger cohort of the previous year missing (Figure 9). Juvenile fish (TL < 21 cm) and the adults are found at depths greater than 100 meters (Fig. 10).

The estimated biomass of *T. trecae* was 27 300 tons, lower than 2006 (31 000) and consisted mainly of individuals larger than 30 cm TL (Figure 10).

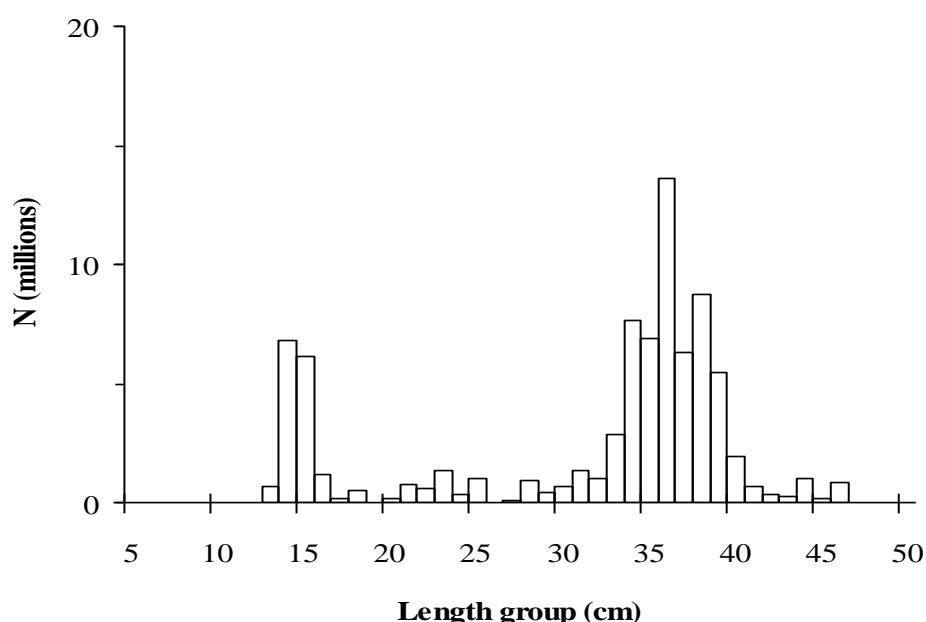

Figure 9. Total length distribution of Cunene horse mackerel (*Trachurus trecae*), Pta. das Palmerinhas-Congo River.

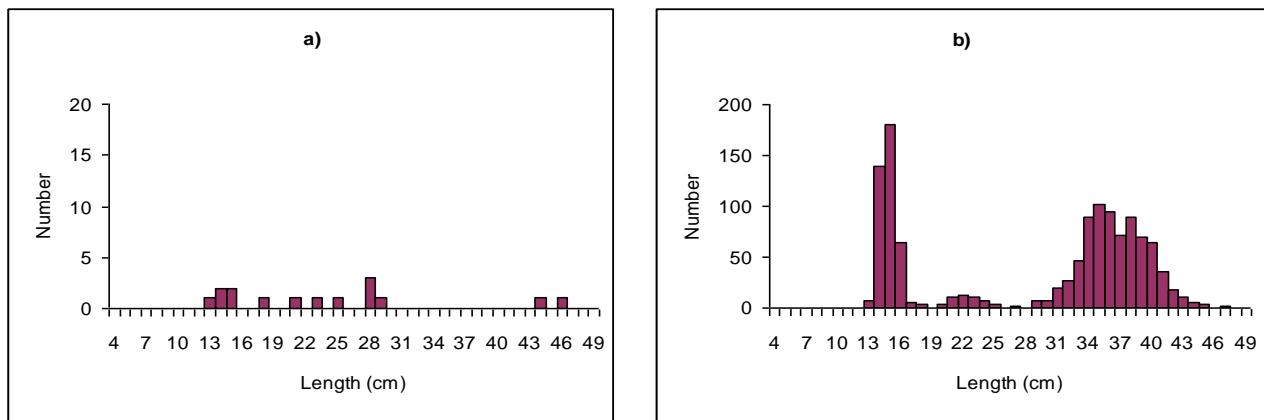

Figure 10. Length distribution of Cunene horse mackerel (*Trachurus trecae*) by depths stratum, Pta. das Palmerinhas-Congo River. a) depths >100 m and b) depths <100 m

Pelagic species Group 1

This group was not abundant enough to estimate its biomass in the region.

Pelagic species Group 2

This group was continuously distributed from north of Cabinda to north of Luanda in low densities ($1 < s_A < 300 \text{ m}^2/\text{NM}^2$) (Figure 11). The dominant species belongs to the Carangids group (Table 4) with *Decapterus rhonchus* and *Selene dorsalis* as the dominating species. The biomass was estimated at 7 000 tons, which is lower than the previous year's biomass estimate (74 500 tons).

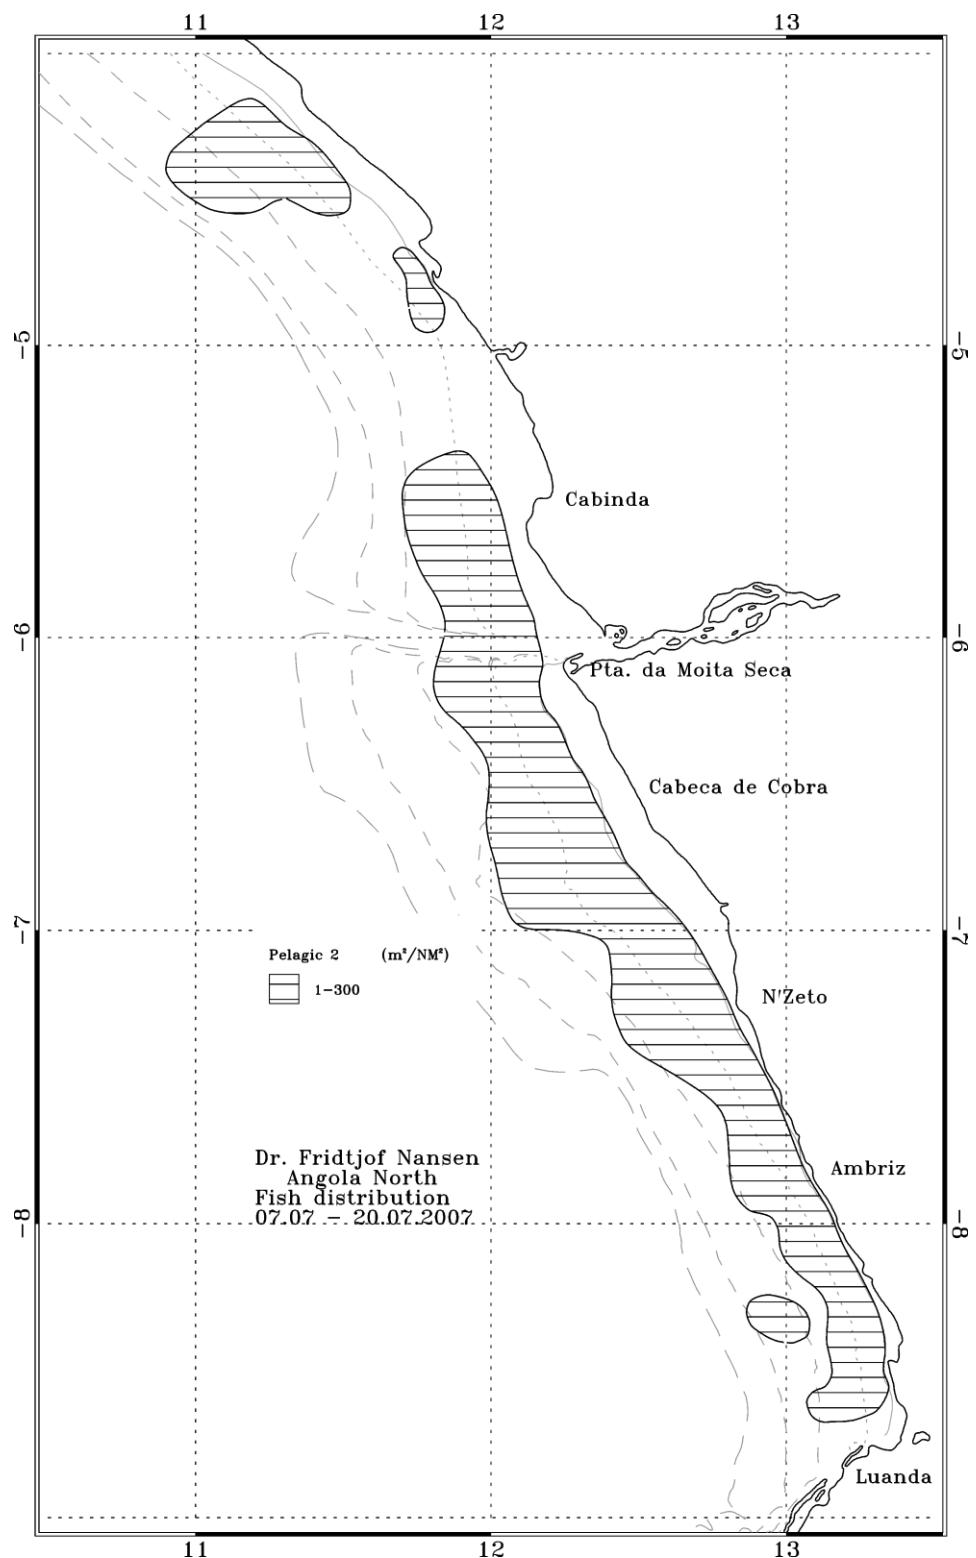

Figure 11. Distribution of Pelagic 2, Pta. das Palmerinhas-Congo River, including Cabinda. Depth contours at 20, 50, 100, 200 and 500 m.

4.3 Pta. das Palmerinhas - Benguela

Sardinella

The sardinella was continuously distributed in this region showing lower densities offshore and denser densities inshore (Figure 12), with high-density patches ($s_A > 10\ 000\ m^2/NM^2$) at both Pta. do Morro and off north of Lobito.

Figure 13 shows the length distribution for (a) *S. maderensis* and (b) *S. aurita*. The size distribution of *S. maderensis* shows two clear cohorts, peaking at 16 and 28 cm. The one cohort consists of juvenile *S. maderensis* ranging from 7 to 19 cm, and an adult cohort ranging from 20 to 34 cm. The length distribution for *S. aurita* shows two modal peaks at 22 and 30 cm with only two adult cohorts.

The sardinella biomass estimated for this region is 483 000 tons, the highest biomass value within the available time series. The biomass of *S. maderensis* was estimated at 288 600 tons, which is double the biomass of the previous year; for *S. aurita* the estimated biomass was 194 400 tons, also double the biomass of 2006. Most of the biomass comprised individuals bigger than 25 cm TL for *S. maderensis* and bigger than 20 cm TL for *S. aurita* (Fig. 13).

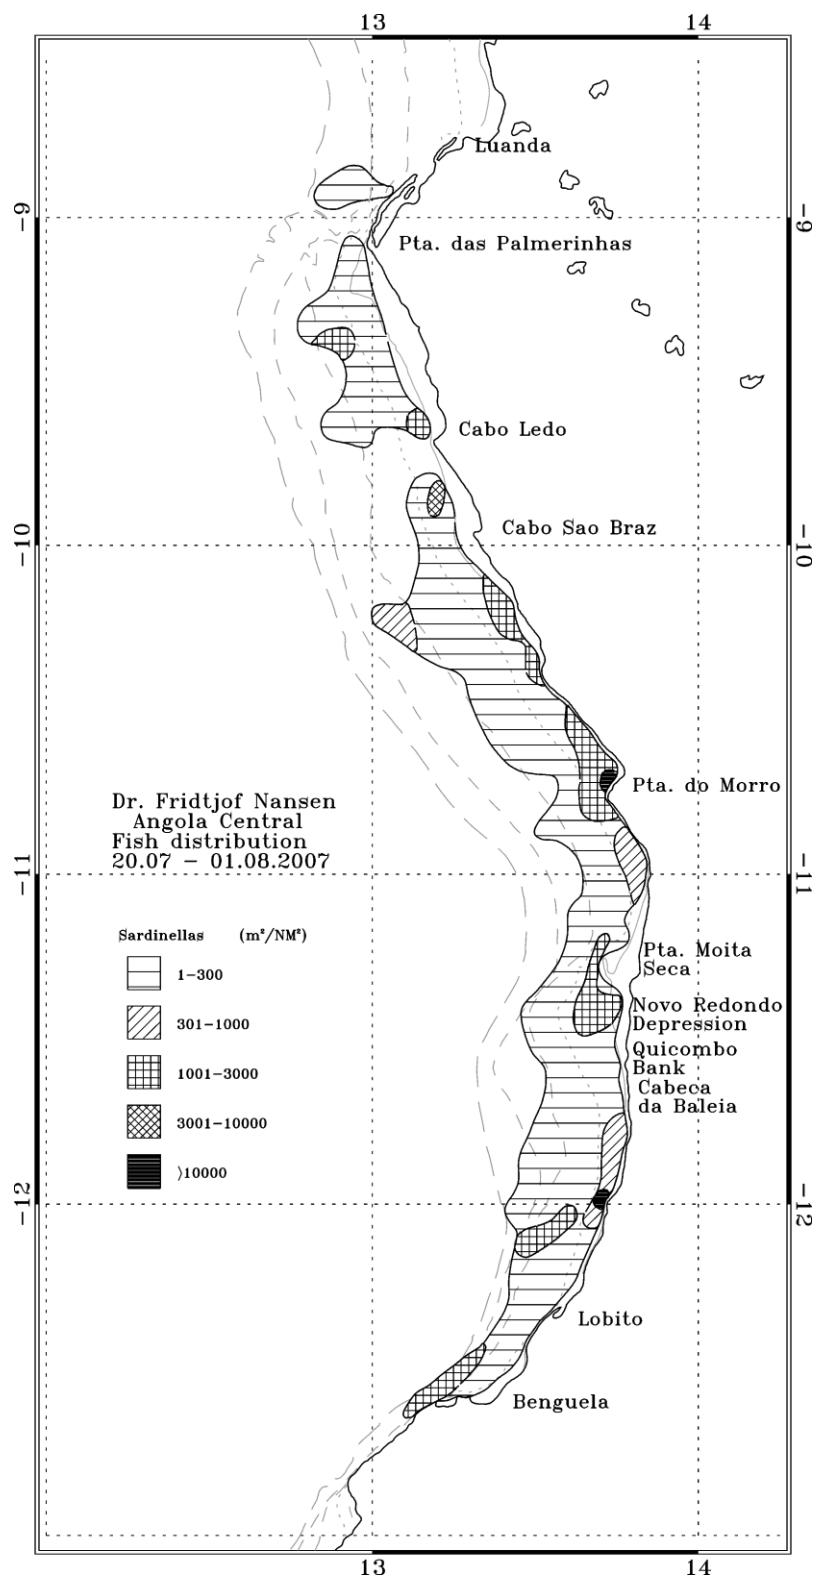

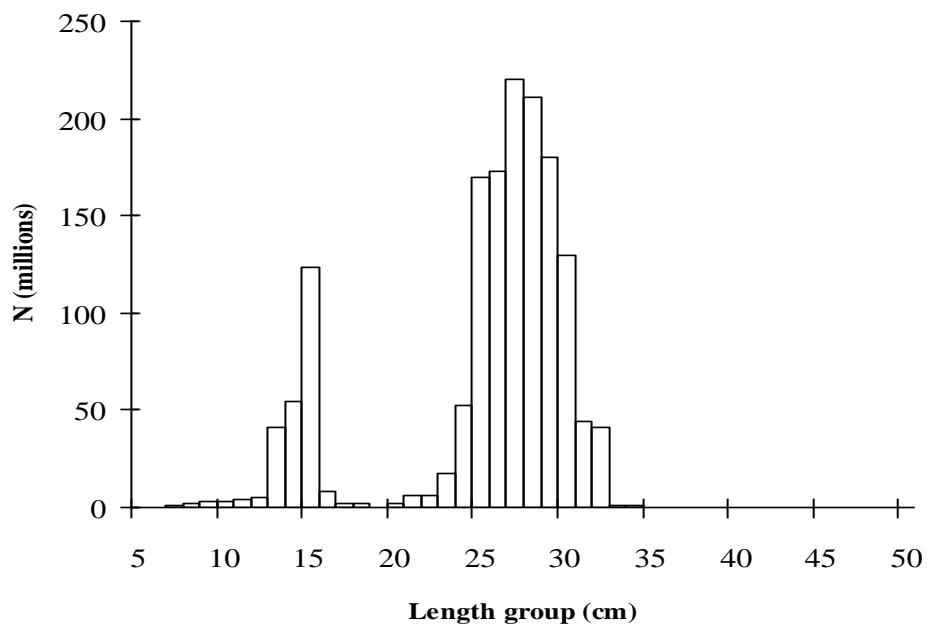

Figure 12. Distribution of *Sardinella* spp. Pta. das Palmerinhas- Benguela. Depth contours at 20, 50, 100 and 200 m.

a) *Sardinella maderensis*

b) *Sardinella aurita*

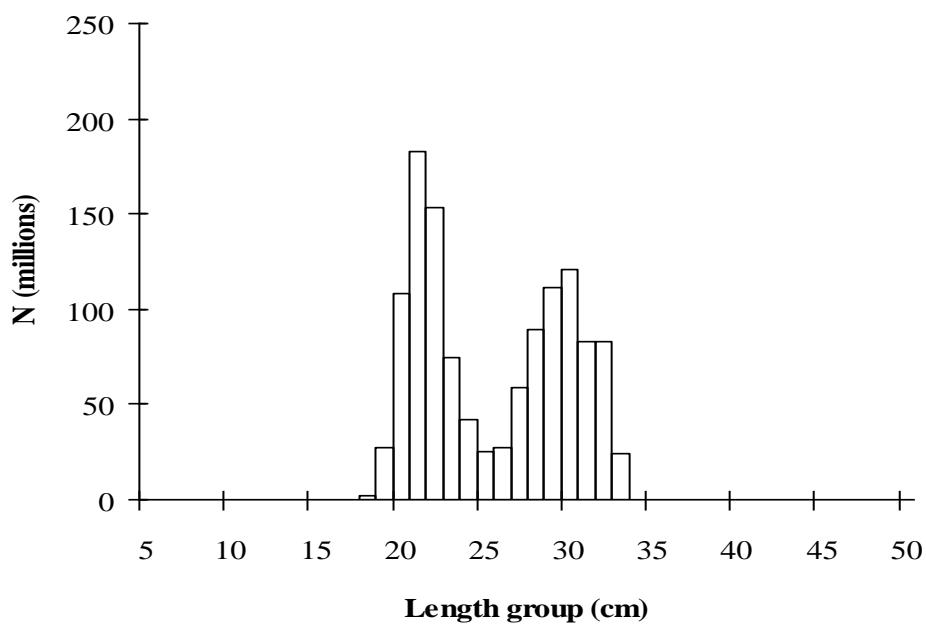

Figure 13. Total length distribution of (a) *Sardinella maderensis* and (b) *S. aurita*. Pta. das Palmerinhas-Benguela.

Horse mackerel

The Cunene horse mackerel, *T. trecae*, was found throughout this area at depths deeper than 20 m (Figure 14) although in low densities ($1 < s_A < 300 \text{ m}^2/\text{NM}^2$). A small dense patch ($3001 < s_A < 10000 \text{ m}^2/\text{NM}^2$) was observed offshore at Pta. do Morro. It appears to be a continuous distribution from north of Pta. Moita Seca to north of Benguela.

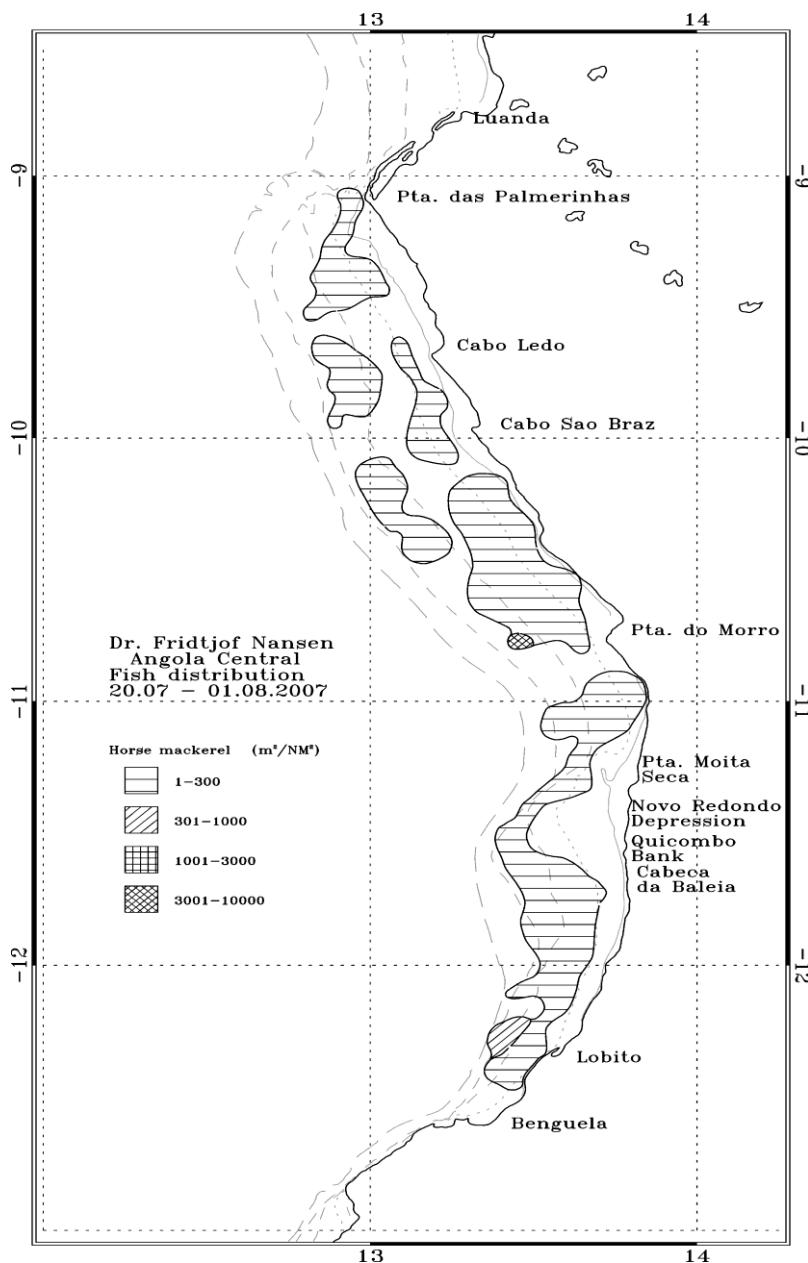

Figure 14. Distribution of horse mackerel (*Trachurus trecae*). Pta. das Palmerinhas- Benguela. Depth contours at 20, 50, 100, 200 and 500 m.

The total length distribution (Figure 15) of this species ranged from 10 to 42 cm and shows two well-defined cohorts with modes at 15 and 28 cm TL. In this region the distribution of Cunene horse mackerel by depths, shows that the juvenile fish (TL < 20cm) is found to school with the adults at depths greater than 100 meter (Figure 16) mainly in the area between Cabo Sao Braz and Pta. do Morro.

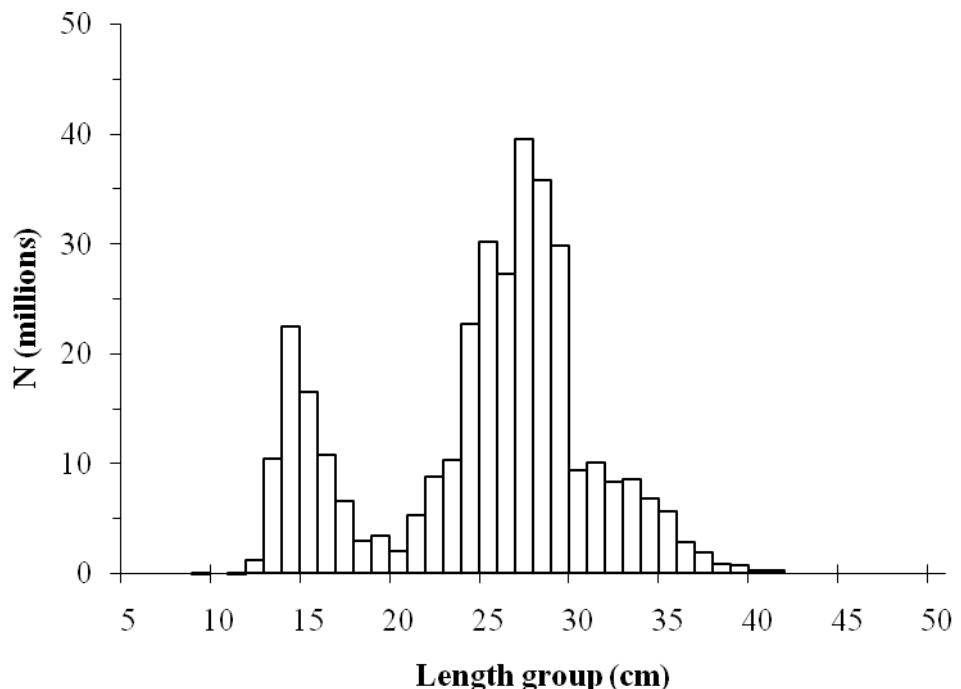

Figure 15. Total length distribution of horse mackerel (*Trachurus trecae*), Benguela - Pta. das Palmerinhas.

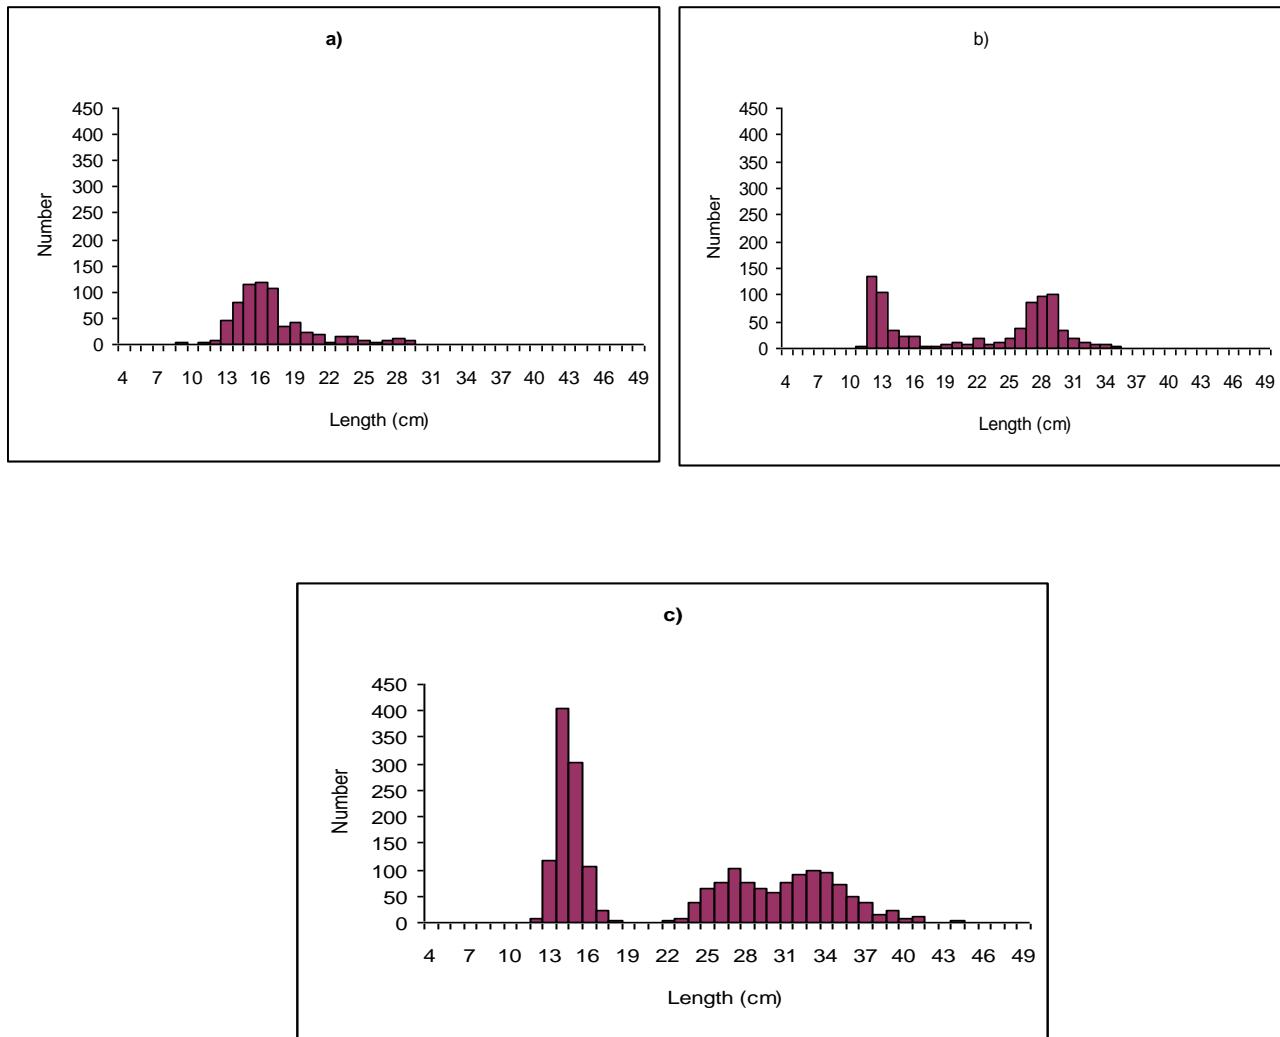

Figure 16. Length distribution of Cunene horse mackerel (*Trachurus trecae*) by depths stratum, Benguela - Pta. das Palmerinhas. a) depths >50 m, b) <50<100 m and c) >100m

The estimated biomass of the Cunene horse mackerel for the area was 54 100 tons, similar to the 2005 estimate (57 000 tons) but lower than 2006 (77 000 tons). The stock in this region was dominated by individuals >25 cm.

Other pelagic species

Group 2

This group is patchily distributed in low densities ($1 < s_A < 300 \text{ m}^2/\text{NM}^2$), with two areas of continuous distribution between north of Cabo Ledo to south of Cabo Sao Braz and north of Lobito to south of Benguela (Figure 17). The most common species group was the Carangidae (Table 5), dominated by *Decapterus rhonchus* and *Caranx sp.*

The biomass estimate, based on an average length of 25 cm and a condition factor equal to 0.01, was 38 000 tons, much lower than the previous year's estimation (113 000 tons).

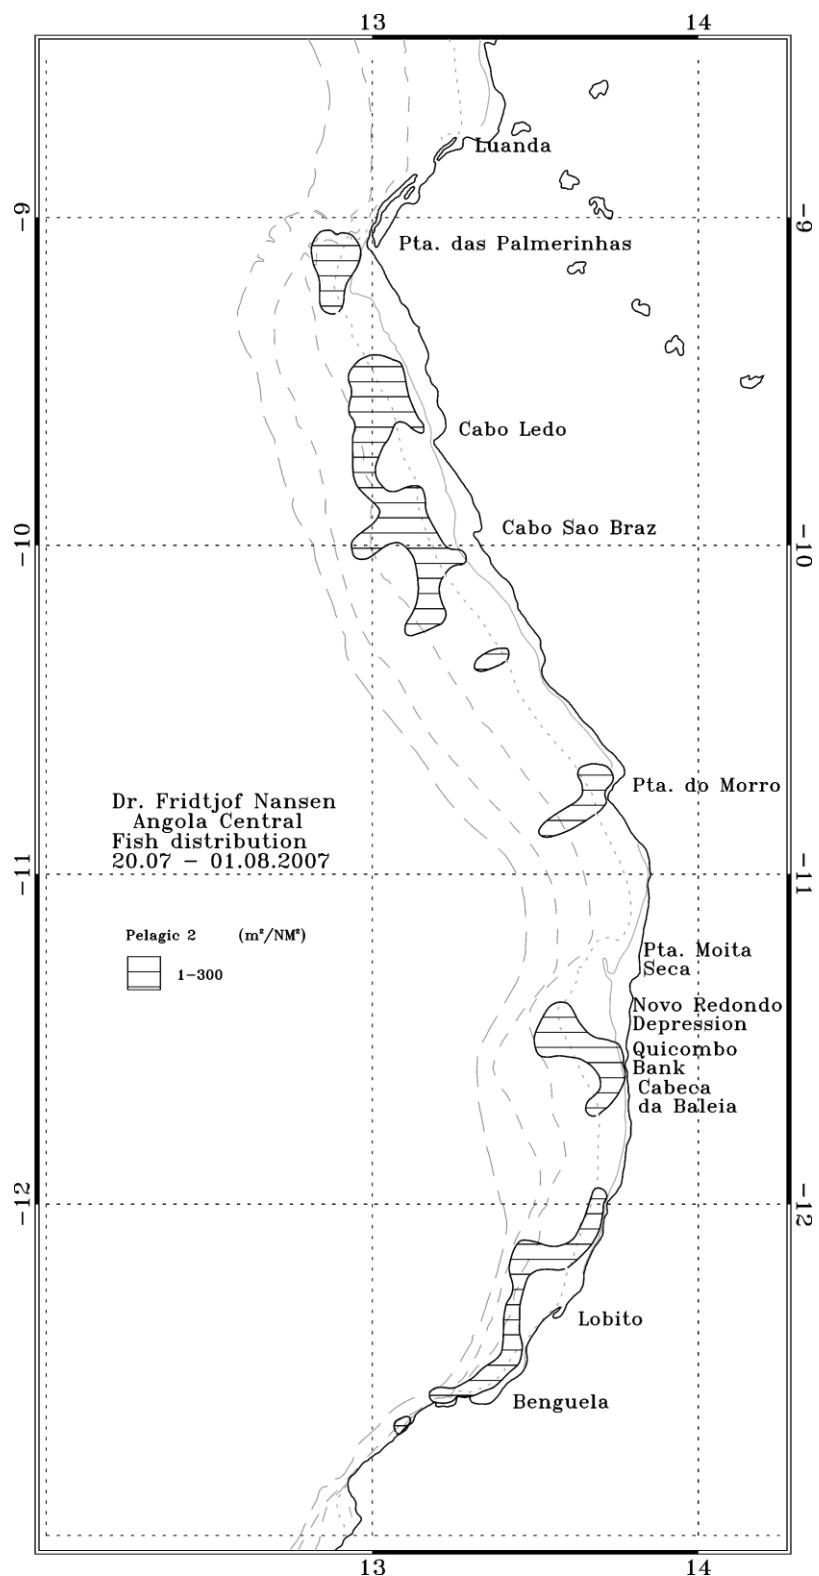

Figure 17. Distribution of other pelagic species, group 2. Pta. das Palmerinhas- Benguela. Depth contours at 20, 50, 100, 200 and 500 m.

Table 5. Catch rates (kg/h) of the main groups of pelagic fish, Pta. das Palmerinhas- Benguela.

Brachydeuterus auritus

This group was found in low densities ($1 < s_A < 300 \text{ m}^2/\text{NM}^2$) throughout of the region (Figure 18).

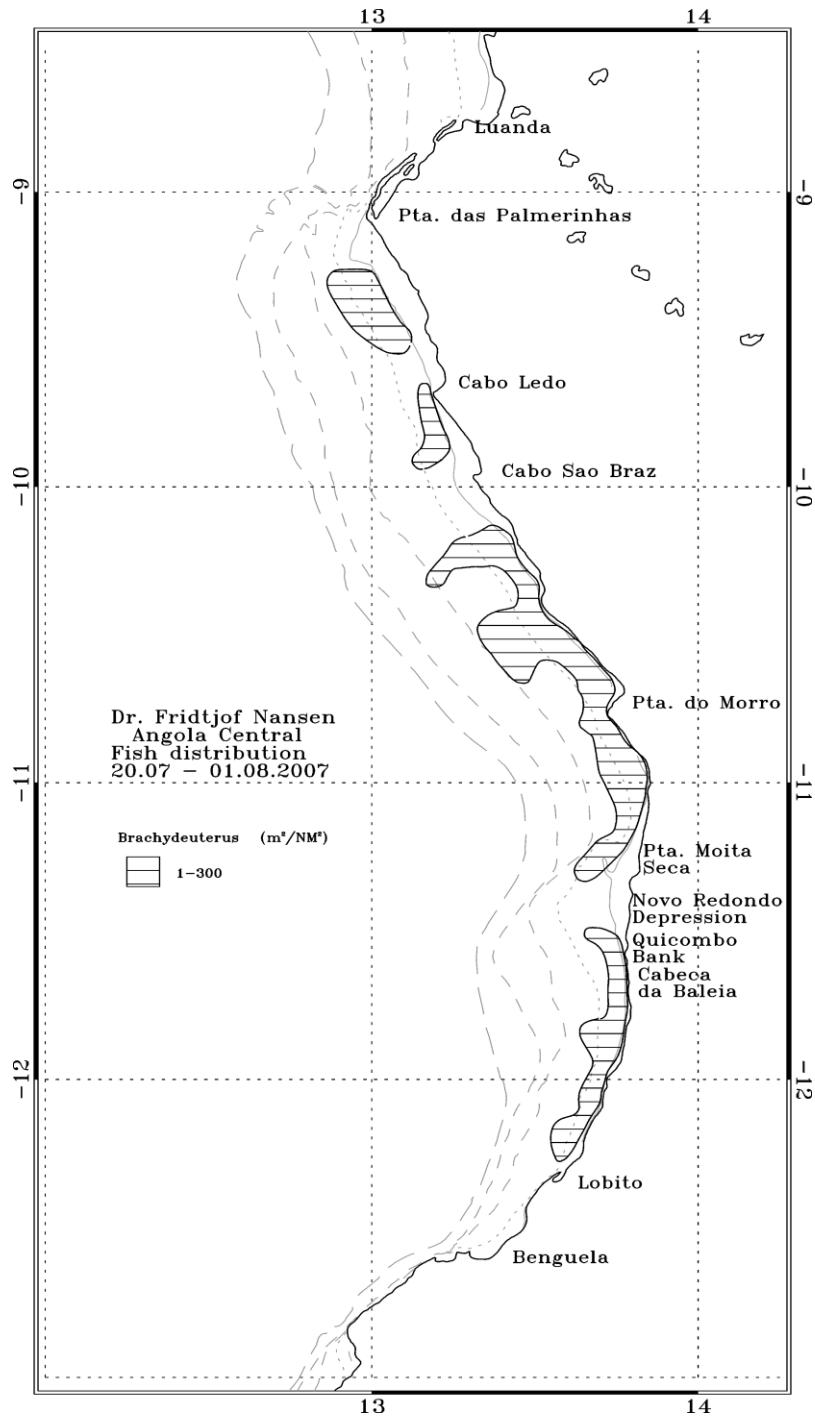

Figure 18. Distribution *Brachydeuterus auritus*. Pta. das Palmerinhas- Benguela. Depth contours at 20, 50, 100, 200 and 500 m.

The biomass estimate, based on an average length of 17cm and a condition factor equal to 0.01, was 13 866 tons.

4.4 Benguela - Cunene

Sardinella

S. aurita is the only sardinella species found in this region (Figure 19). It was found in confined small patchy areas. A dense patch ($3001 < s_A < 10\ 000 \text{ m}^2/\text{NM}^2$) was observed south off Pta. Albina.

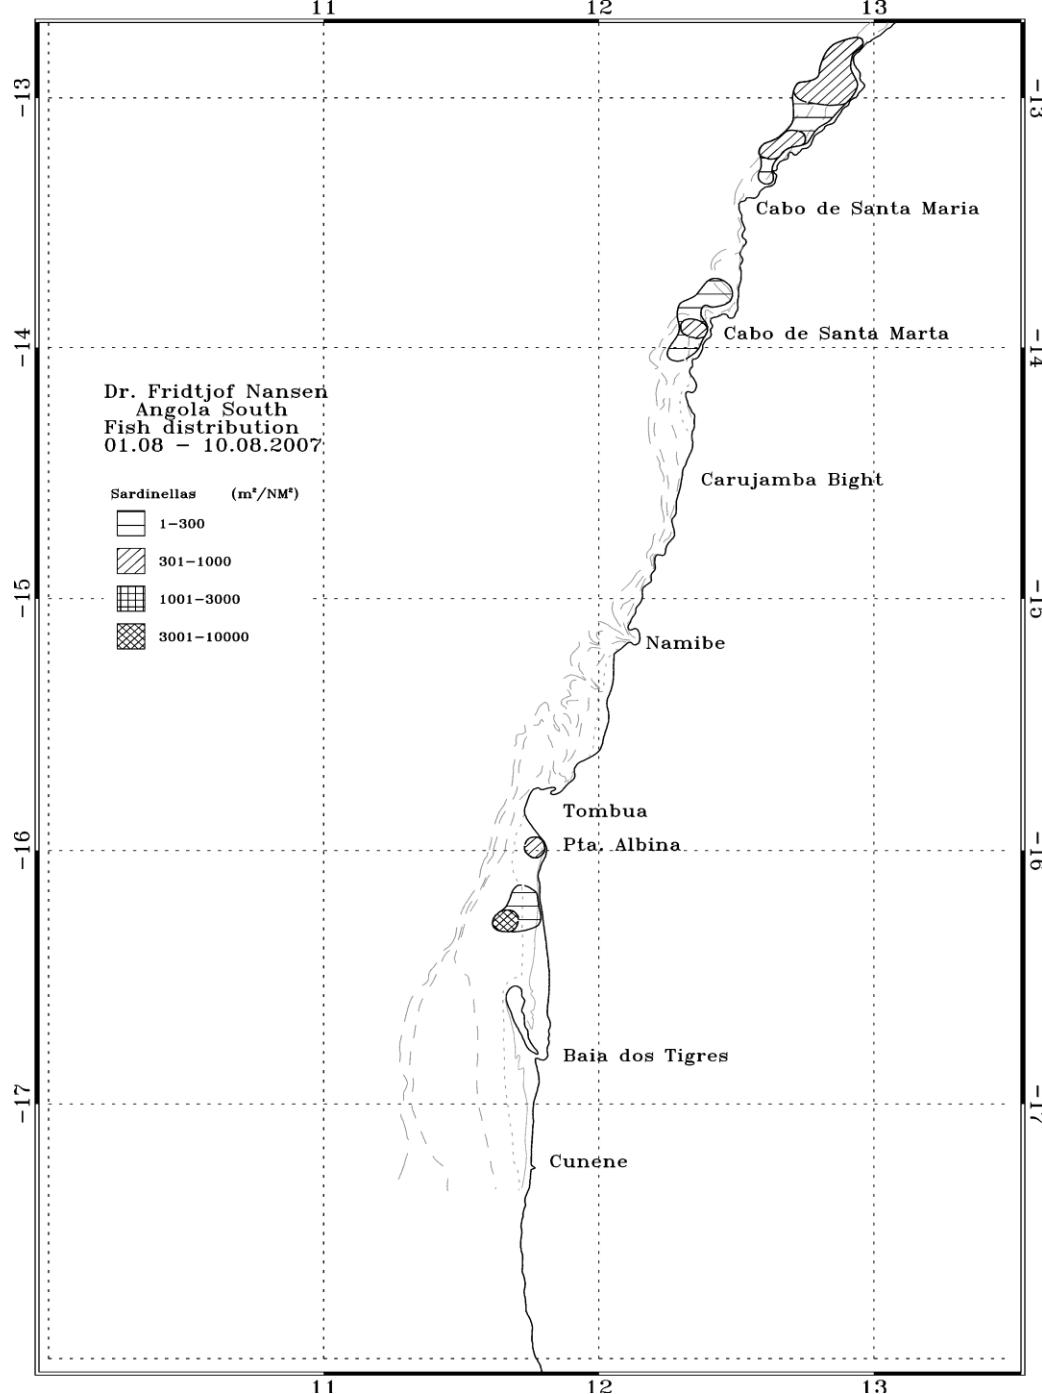

Figure 19. Distribution of Sardinella. Cunene–Benguela. Depth contours at 10, 20, 50, 100, 200 and 500 m.

The size distribution showed one cohort, ranging in size from 19 to 27 cm (Figure 20).

The estimated biomass for the sardinella (55 900 tons) increased by 73%, compared with the 20 000 tons of 2006.

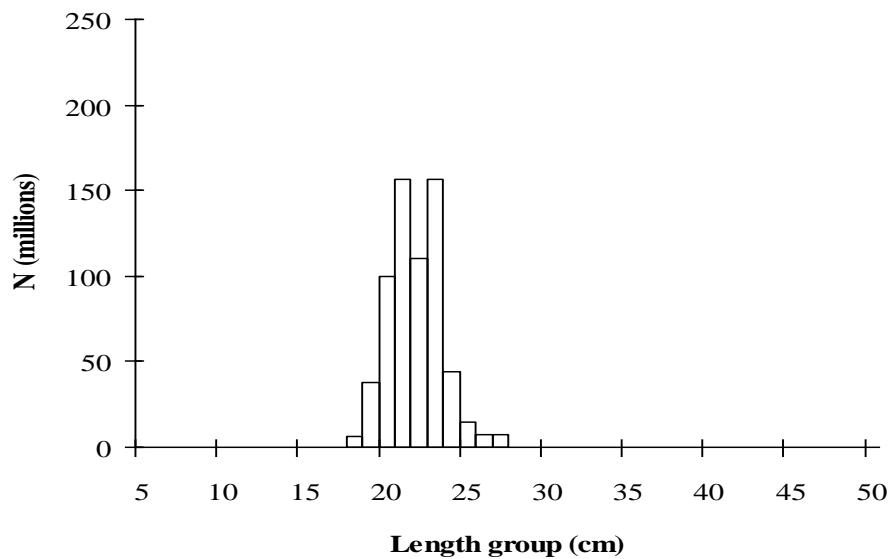

Figure 20. Distribution of *Sardinella aurita*. Cunene–Benguela. Depth contours at 10, 20, 50, 100, 200 and 500 m.

Horse mackerel

In the southern region the horse mackerel is found in abundance, dominating over other species in the region. Like in previous years, both species of horse mackerel were found: Cunene horse mackerel (*T. trecae*), a species that distributes in most of the Angolan continental shelf and the Cape horse mackerel (*T. capensis*) a species associated with the cold waters of the Benguela current. There seems to be a continuous distribution from south of Cabo de Santa Marta to the Cunene River with low densities ($1 < s_A < 300 \text{ m}^2/\text{NM}^2$) (Figure 21). However, around Baía dos Tigres, and at depths between 100 to 200 m, a dense patch ($s_A > 3000 \text{ m}^2/\text{NM}^2$) was found. In general, Cape horse mackerel was found dominating the slope area, while Cunene horse mackerel had a more inshore distribution.

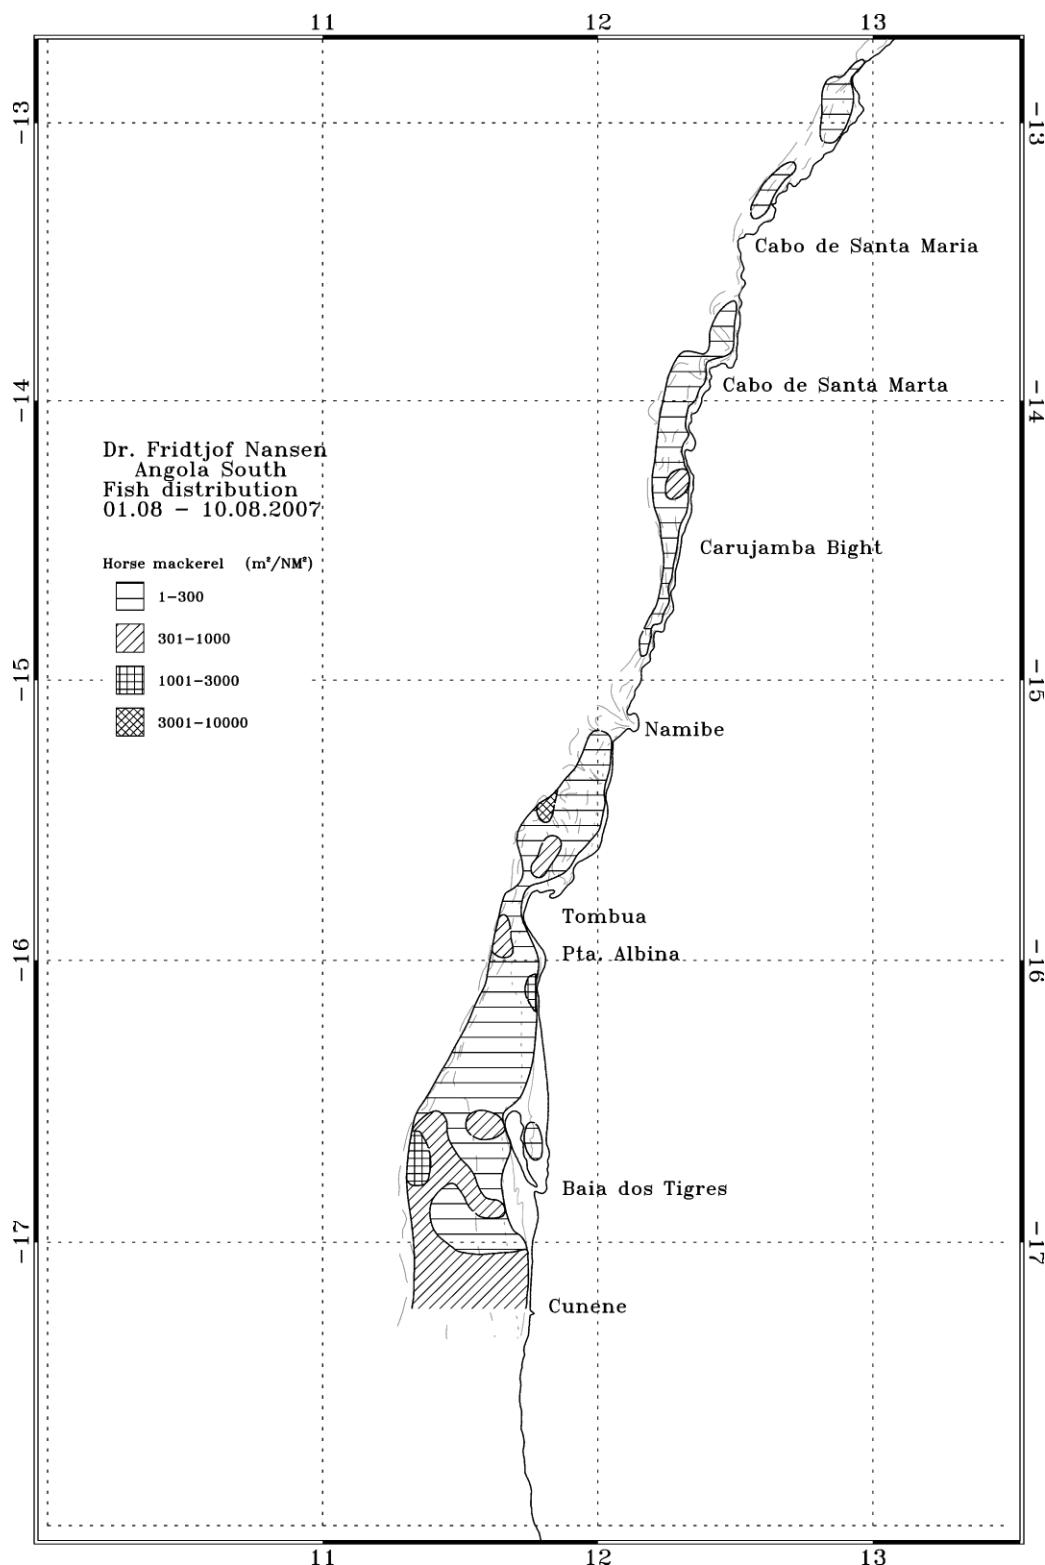

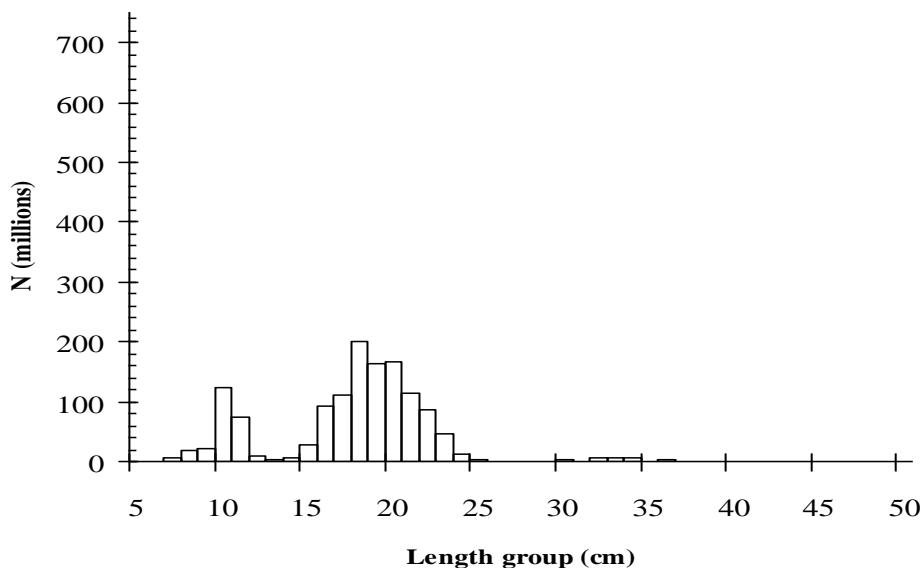

Figure 21. Distribution of horse mackerel. Cunene–Benguela. Depth contours at 10, 20, 50, 100, 200 and 500 m.

Figure 22 shows the size distributions of both horse mackerel species: (a) *Trachurus capensis* and, (b) *Trachurus trecae*. The length distributions of both species was dominated by juvenile fish smaller than 20cm. *T. capensis* showed two clear cohorts, with modal peaks at 11 and 19 cm. The average total length of *T. trecae* is 15cm and its length distribution showed three cohorts.

Trachurus trachurus capensis

b) *Trachurus trecae*

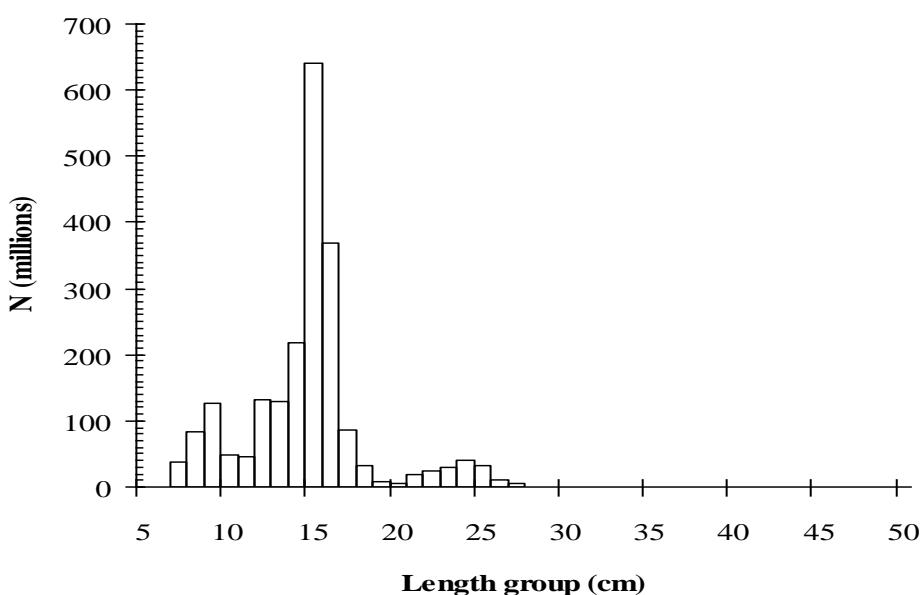

Figure 22 Total length distributions of (a) *Trachurus trachurus capensis* and (b) *T. trecae* (b), Benguela-Cunene.

The total estimated biomass for horse mackerel in the southern region was 147 700 tons, 50% higher than the one from 2006 (71 000 tons), with each species contributing with about 50% to the total estimated biomass. In comparisons to last year's biomass, there has been an increase of 62% (72 800 tons) for *T. trace* and of 75% (74 900 tons) for *T. capensis*.

Other species

Unlike the previous years, anchovy and sardine were found around the area between Baía dos Tigres and the Cunene (Figure 23). A high concentration spot of anchovy was found inside the bay with a density higher than $10\ 000\ m^2/NM^2$. The sardine showed low abundance thus no biomass could be estimated.

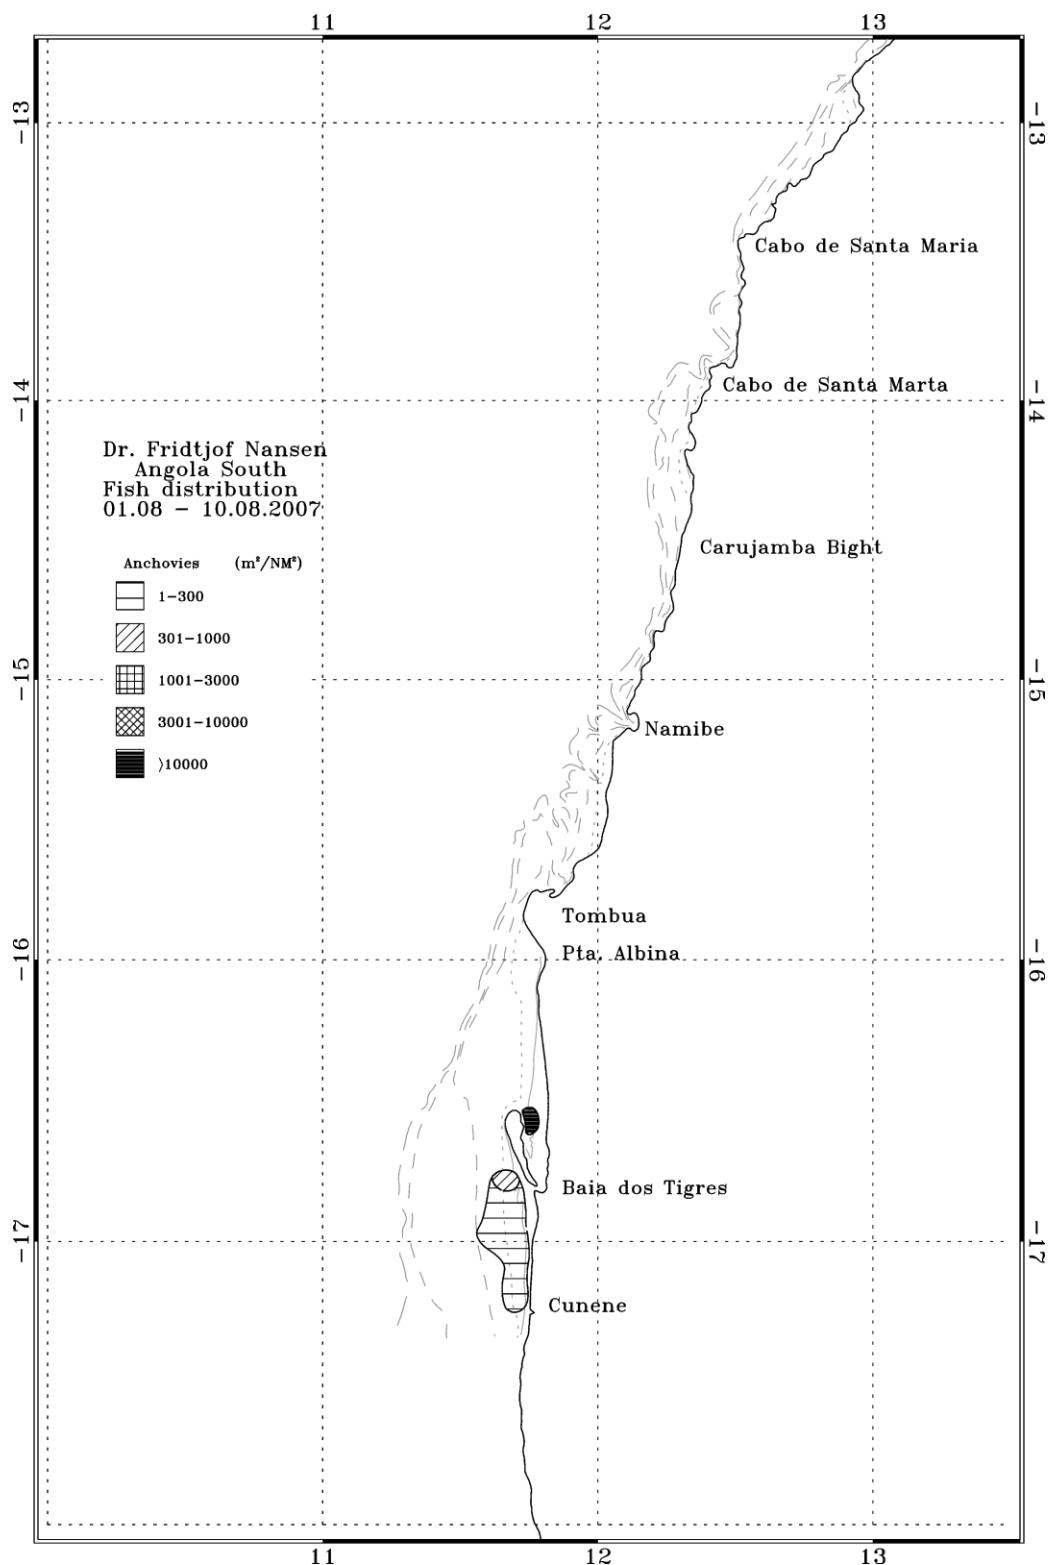

Figure 23. Distribution of Anchovies. Cunene–Benguela. Depth contours at 10, 20, 50, 100, 200 and 500 m.

CHAPTER 5 SUMMARY OF SURVEY RESULTS

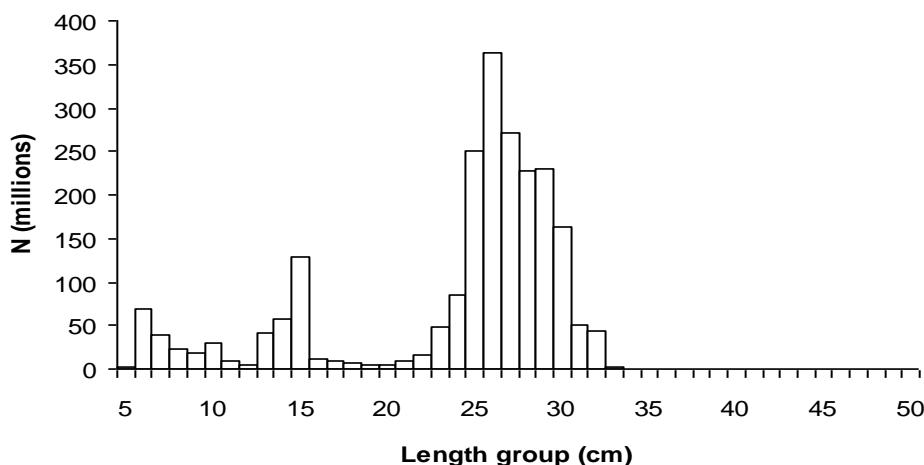

5.1 Sardinella

The total biomass estimate for sardinellas is 726 700 tons, which is the highest biomass recorded during the time series (Table 6). The increase can be attributed to changes in the behaviour pattern of the species: a slightly deeper (less surface schools) and more offshore distribution, making the sardinella more available for acoustic detection. Such changes are common and may be related to prevailing environmental conditions. During the present survey sardinella was found further south and more abundant than previous years.

The relative biomass of the two *Sardinella* species was somewhat different than in previous year. This year, the two species were estimated to be approximately at the same level (*S. aurita* 53 %, *S. maderensis* 47 %). The relative distribution was similar in the northern region (57 % *S. aurita*) and central region (46 %). However, only *S. aurita* was found in the southern region. Nevertheless, the contribution of each species has varied in the last years depending on the environmental conditions: in 2005 *S. aurita* contributed the most, while last year it was *S. maderensis*, this last species preferring warmer waters (>23°C) than the former one.

Figure 24 shows the overall length frequency distribution of the two *Sardinella* species. For *S. maderensis*, three cohorts with modal peaks around 6, 15 and 27 cm TL can be observed. New this year is the indication of some new recruits to the fishery (fig. 24a). However, no such indication of recruitment was found for *S. aurita* this year either. The distribution for this species shows two modal peaks at 21 and 30 cm TL (Fig. 24 b).

5.2 Cunene horse mackerel

The total biomass of Cunene horse mackerel was estimated at 154 100 tons, which is very similar to the one estimated in 2006 (153 000 tons) (Table 7). This year's estimate is a result of an increase in the horse mackerel biomass in the south.

As in 2006, 90% of the total biomass in the southern region was dominated by juveniles, $TL < 21$ cm. For management purposes, this region must be considered as the main recruitment area for the Cunene horse mackerel. However, since juveniles and adults seem to be schooling

together, it is difficult to set up depth restrictions as management measure. In the northern and central regions the biomass comprised mostly adult population.

The overall length distribution shows that fish of all classes were represented, from the smallest of 8 cm TL to those bigger than 4035 cm TL. However, fish <20 cm TL dominates the distribution. From the size distribution, three clear cohorts can be distinguished, with modes at 8, 16, and 25 cm TL.

- a) Overall length distribution of *T. trecae*.

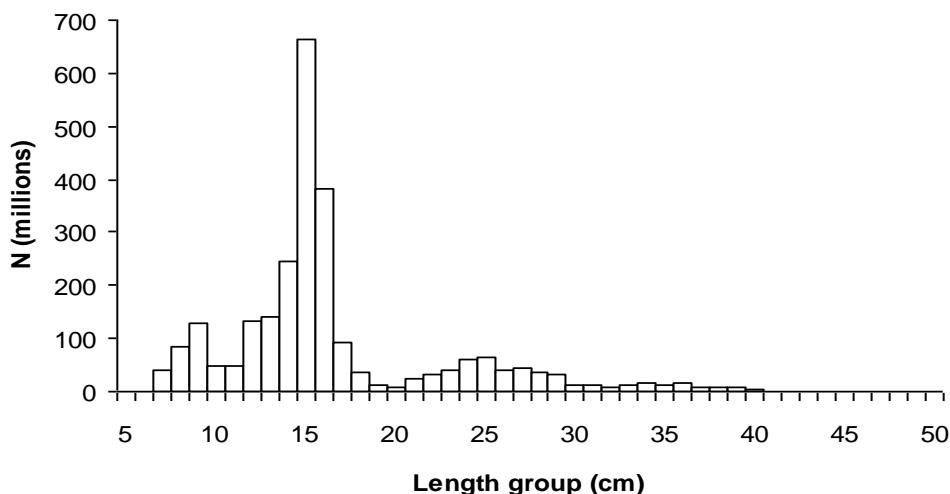

Figure 25 Overall length distribution in numbers of *T. trecae*.

5.3 Conclusions

In the present survey the environmental conditions were characterized by strong wind, especially in the southern region and different temperatures as compared with previous years. The range of temperatures encountered in the central and northern regions was 19° to 22°C, (last year: 21° to 25°C), while in the south and in the main area of horse mackerel distribution temperatures were higher (17° to 19°C) compared with 2006 (15° to 16°C).

From the acoustic records it seems that Sardinella has a more offshore distribution, which makes the resource more detectable acoustically. The total biomass estimate for sardinellas (726 700 tons) was higher than last year (630 000 tons). During this survey the *S. aurita* has distributed throughout the Angolan coast.

The proportion of biomass of the two species of Sardinella showed a different pattern throughout the Angolan coast *S. aurita* dominates the northern, while *S. maderensis* dominates the central region (54 %)

The total biomass of horse mackerel was estimated at 232 000 tons. The Cunene horse mackerel stock was estimated at 154 000 tons, which is at the level of the biomass estimated in 2006. Cape horse mackerel was found only in the southern region with an estimate biomass of around 74 900 tons. However, the Cunene horse mackerel stock is still far from the levels of the 90's.

The overall length distribution of Cunene horse mackerel was still dominated by fish <30 cm TL. Comparing with last year's overall length distribution, we can notice a more even size distribution and a slight increase in the proportion of individuals >30 cm TL. This size increment is more evident in the north and central regions.

ANNEX I Fishing gear used

5.4 Fishing gear

The vessel has two different sized "Åkrahamn" pelagic trawls and one "Gisund super bottom trawl". During the present survey only the bottom trawl was used.

The bottom trawl has a headline of 31 m, footrope 47 m and 20 mm meshsize in the codend with an innernet of 10 mm meshsize. The trawl height was about 4.5 m and distance between wings during towing about 21 m. The sweeps are 40 m long. The trawl is equipped with a 12" rubber bobbins gear. The doors are of 'Thyborøn' combi type, 7.81 m^2 , 1670 kg. During the present survey the door distance was kept nearly constant at about 50 m at all depths by the use of a 9.5 m strap between the wires at 130 m distance from the doors (normally applied at depths greater than 80 m). At depths greater than 300 m the trawl was equipped with a tickler chain, which improves the catchability of bottom living and borrowing species, particularly shrimps.

The SCANMAR system was used on all trawl hauls. This equipment consists of sensors, a hydrophone, a receiver, a display unit and a battery charger. Communication between sensors and ship is based on acoustic transmission. The doors are fitted with sensors to provide information on their distance, and the trawl was equipped with a trawl eye that provides information about the trawl opening. A catch sensor on the cod-end indicated the size of the catch.

ANNEX III Acoustic Instruments

The Simrad EK-60/38kHz scientific sounder was run during the survey only for observation of fish and bottom conditions.

The details of the settings of the 38kHz echo sounder were as follows (Driftjournal 1. Kalibrering av referansekule, 06.10):

Transceiver-1 menu (38 kHz lowering keel)

Transducer depth	5.50 m
Absorbtion coeff.	8,7 dB/km
Pulse length	medium (1,02ms)
Bandwidth	wide
Max power	2000 Watt
2-way beam angle	-20,6dB
SV transducer gain	25,87 dB
TS transducer gain	26,5 dB
Angle sensitivity	21.9
3 dB beamwidth	6.9° along ship 6.9° athwartship
Alongship offset	-0.11°
Athwartship offset	0.08°

Display menu

Echogram	1 (38 kHz)
Bottom range	15 m
Bottom range start	10 m
Sv colour min	-70 dB

Bottom detection menu Minimum level -40 dB
